Special Issue Reprint

Geometry and Topology with Applications

Edited by: Daniele Ettore Otera

This reprint is a Special Issue of MDPI's *Mathematics*, titled “Geometry and Topology with Applications”, and it collects several papers that are in some way related to the general research field of geometry. More specifically, among the 13 papers composing the reprint, there are several specific topics, ranging from low-dimensional topology to geometric group theory, differential geometry to algebraic topology, and group theory to graph theory. The aim of this Special Issue was indeed to present new research concerning geometry and topology, broadly speaking, with applications. Some of the authors of these papers are scientists working in well-known research centers in France, Italy, Lithuania, Croatia, Korea, South Africa, China, etc.

We hope that the published works will have a positive impact, inspiring other researchers to further develop some of the topics covered in this reprint.
