Throughout a building's service life, its structure will inevitably face multiple hazards, such as seismic and wind events. The vulnerability of buildings under the impact of multi-hazards has become a significant issue for the sustainable development of society. This issue can be approached fundamentally by enhancing the resilience of buildings against multi-hazards, e.g., seismic and wind hazards, and updating design approaches. To this end, we launched the Special Issue of *Buildings* titled "Structural Reliability, Resilience and Design of Buildings against Multi-hazards". The main aim of this Special Issue, reprinted here, is to explore the recent challenges and developments in the field of reliability assessment, resilience evaluation/enhancement techniques, and structural design theories for individual building structures and clusters under multiple hazards.

MDPI Books offers quality open access book publishing to promote the exchange of ideas and knowledge in a globalized world. MDPI Books encompasses all the benefits of open access – high availability and visibility, as well as wide and rapid dissemination.
