The Reprint of the Special Issue “Soil Quality and Innovation in Agriculture: Dynamics, Indicators, and Sustainability” examines the crucial concept of soil quality, integrating insights from 13 original studies across diverse global regions. It focuses on the relationships between biological, chemical, and physical soil parameters in the context of sustainable land use and management. The Issue's key themes explore how soil quality is affected by carbon and nutrient dynamics, organic amendments, and long-term practices like no-till systems. The research also investigates innovative methods for soil enhancement and pollution mitigation, the impact of urbanization on soil health, and the identification of key soil quality factors and indicators. The collection aims to provide knowledge for guiding evidence-based policy and adaptive management for resilient, productive soil systems.
