It is generally recognized that the success of bone regeneration depends not only on the choice of a particular surgical technique and the clinical experience of the therapist but also on the knowledge, correct selection, and use of various biomaterials. Therefore, the science of biomaterials is one of the fastest growing disciplines in dentistry, and a more thorough knowledge of the properties of existing biomaterials and the development of new biomaterials are certainly areas that require special research attention. We believe that the topic of this Special Issue is of great importance to professionals working in the field of tissue engineering, dental implantology, and regenerative dentistry.
