Pancreatic neoplasms include different pathological entities with variable biological behavior and different treatment modalities. Surgery and adjuvant therapy are the cornerstones of the therapeutic approach; however, even after radical resection, the majority of patients experience disease recurrence and the prognosis of pancreatic cancer remains dismal.

A multimodal therapeutic approach, based on a combination of neoadjuvant therapy, chemotherapy, radiotherapy, immunotherapy and surgery, appears fundamental to improving the outcomes.

This Special Issue of the *Journal of Clinical Medicine*, entitled “Recent Advances in Pancreatic Neoplasms”, focuses on possible new strategies to treat pancreatic neoplasms.
