This book is a printed edition of the Special Issue “Multiple Roles for Landscape Ecology in Future Farming Systems” that was published in *Land*. This book aims to inspire landscape ecologists to explore theories and practical tools that can assist in the planning, design, modification, and development of new farming landscapes with the best environmental, economic, and social outcomes in mind. It is also hoped that it will contribute toward developing land systems and land management practices for specific landscapes that meet the goals of increased nutritious food production in the face of market and climatic variability whilst reducing environmental impacts and enhancing natural capital and assisting to drive and support the transformative changes in the socioeconomic and environmental systems of rural areas required for future food production.
