The interaction of the artificial living communities of cities and the examination of the interaction between plants, plants and microorganisms, and plants and animals is an essential part of sustainability. Creating vital urban areas and increasing their biodiversity is also necessary for sustainability. The monitoring and research of settlement communities as ecological systems serves to a large extent to the perception of the effects of climate change and helps to mitigate them. The sustainability and economic operation of established urban green space systems can be made effective by applying innovative technologies.

This Special Issue aims to draw attention to this wide-ranging multidisciplinary research work and to offer solutions for modern urban green space management.
