This Special Issue serves as a compendium of the most recent advancements in the field of multiple-input multiple-output (MIMO) radars, including a wide array of high-potential research domains. These areas span across both theoretical frameworks and practical applications. Its key focal points include MIMO radar waveform design, MIMO signal detection, parameter estimation and imaging, as well as MIMO clutter and jamming suppression techniques. The primary objective of this Special Issue is to stimulate the generation of innovative ideas while fostering enhanced communication and collaboration opportunities among students and researchers actively involved in the field of MIMO radar research.
