GIS Applications in Green Development

Edited by: Yannis Maniatis

This Special Issue delves into the realm of geographic information systems (GIS) and their pivotal role in fostering green development. Featuring a collection of rigorous research articles authored by esteemed experts in the field, this compilation offers insights into the applications of GIS within the domain of sustainable development. These contributions underscore GIS as an indispensable tool in sustainable development endeavors. We hope that these contributions shed light on the ability of GIS to inform decision-making processes, facilitate renewable energy planning, and contribute to disaster management strategies. The scientific rigor and advancements showcased in this Special Issue can provide a comprehensive understanding of how GIS is steering progress in green development.
