The term “landsenses” is derived from “landsenses ecology”, a recently emerging scientific discipline grounded in ecological principles and an analytical framework encompassing natural elements, physical senses, psychological perceptions, socio-economic perspectives, process risk and related aspects. Landsenses emphasize the incorporation of human perception from sensory and psychological dimensions into ecological environmental research. Within this framework, we believe the theory advanced by landsense ecology not only offers an effective avenue for investigating the relationship between humans and the environment, but also serves as a crucial methodological and technical approach for the development of green spaces in the context of constructing smart and resilient cities. This reprint comprises 13 papers encompassing multi-sensory studies conducted in green spaces and an editorial published in the Special Issue of *Forests* titled “Landsenses in Green Spaces”.
