Novel electrocardiographic criteria along with new algorithms for the diagnostics and treatment of arrhythmias have been proposed, enabling more personalized patient management, including more rational use of imaging, implantable cardioverter-defibrillators, cardiac resynchronization therapy, and catheter ablation. The progress also concerns the diagnostics, treatment, and classification of arrhythmogenic disorders. Moreover, advancements in imaging and cardiovascular genetics make better diagnostics and risk stratification possible. However, personalized paths in arrhythmia management are increasingly needed.
