This Special Issue focuses on innovative diagnostic technologies and their role in enhancing the detection of pathologies, dimorphisms, and dysfunctions in the orofacial region. Recent advances such as EMG, CBCT, and MRI are gaining prominence in dental applications, expanding the scope of diagnosis and treatment, particularly in craniofacial and temporomandibular disorders. Telemedicine, including teledentistry, is rapidly evolving as a means of providing remote consultation and healthcare, offering efficiency in terms of time, cost, and quality. The evidence presented in this reprint aims to guide practitioners in adopting these new technologies for improved diagnostic and therapeutic outcomes.
