Abstract: This paper implements the trial equation approach to retrieve cubic–quartic optical solitons in fiber Bragg gratings with the aid of the trial equation methodology. Five forms of nonlinear refractive index structures are considered. They are the Kerr law, the parabolic law, the polynomial law, the quadratic–cubic law, and the parabolic nonlocal law. Dark and singular soliton solutions are recovered along with Jacobi’s elliptic functions with an appropriate modulus of ellipticity.

Keywords: Bragg gratings; solitons; cubic–quartic

MSC: 78A60

1. Introduction

The dynamics of optical solitons have revolutionized modern-day telecommunication engineering. Intercontinental long-distance communication technology has immeasurably advanced. These soliton molecules or pulses constitute the fundamentals of the engineering of such communications. Yet, there pressing issues still need to be addressed for smooth and sustainable soliton propagation across long distances through optical fibers [1–5]. Occasionally, the chromatic dispersion (CD) gradually becomes depleted during soliton transmission over intercontinental distances. This has led to the replacement of CD with the collective effect of third-order and fourth-order dispersions. Together, this is referred to as cubic–quartic (CQ) dispersion, which has led to the emergence of CQ solitons [6–10]. Another countermeasure to circumvent the effect of the depletion of CD is to introduce a grating structure along the internal walls of the fiber core, which produces dispersive reflectivity [11–15]. This technology was first introduced by Bragg; hence, it is referred to as a Bragg grating. The current paper combines both such measures to lead to the structure of the governing models [16–20]. Five forms of nonlinear refractive index structures are also studied in this paper.
The model is modified for each of these nonlinear forms. They are individually studied by the aid of the trial equation approach, and the soliton solutions are recovered. The fundamental solutions in terms of Jacobi’s elliptic functions naturally emerge from the integration scheme. Subsequently, when the limiting approach to these elliptic functions are implemented, with respect to the modulus of ellipticity, the soliton solutions emerge. Thus, the integration scheme is a double-layered process to yield soliton solutions from the model. It must also be noted that only dark and singular soliton solutions emerge from this mathematical scheme.

2. Trial Equation Method

Step 1. Consider a model equation

\[ G(u, u_x, u_t, u_{xx}, u_{xt}, u_{tt}, \cdots) = 0, \]  

where \( u \) is the dependent variable, and \( x \) and \( t \) are the independent variables. Take the wave variable

\[ \xi = h(x - mt), \quad u(x, t) = u(\xi), \]  

where \( h \) and \( m \) are constants. Substituting Equation (2) into Equation (1) yields an ordinary differential equation

\[ G(u, u', u'', \cdots) = 0. \]  

Step 2. Take the trial equation \[21–28\]

\[ u'' = \sum_{i=0}^{n} s_i u^i(\xi), \]  

where \( n \) comes from the balance algorithm, and we derive

\[ (u')^2 = F(u) = \sum_{i=0}^{n} \frac{2s_i}{i+1} u^{i+1} + s, \]  

\[ u''' = \sum_{i=2}^{n} i(i-1) s_i u^{i-2} \left( \sum_{i=0}^{n} \frac{2s_i}{i+1} u^{i+1} + s \right) + \left( \sum_{i=1}^{n} i s_i u^{i-1} \right) \left( \sum_{i=0}^{n} s_i u^i \right). \]  

Inserting Equation (4) into Equation (3) leaves us with a system of equations that enables us to obtain the values of \( s_i \) and \( s \).

Step 3. Write Equation (5) as the standard integral form

\[ \pm (\xi - \xi_0) = \int \frac{du}{\sqrt{F(u)}}. \]  

Then, we can obtain the solutions to Equation (1) by solving the integral (7).

3. Application to Fiber Bragg Gratings

3.1. Kerr Law

In this case, the model is

\[ iq_t + ia_1 q_{xxx} + b_1 r_{xxxx} + (c_1 |q|^2 + d_1 |r|^2) q + ia_1 q_x + \beta_1 r = 0, \]  

\[ ir_t + ia_2 q_{xxx} + b_2 r_{xxxx} + (c_2 |r|^2 + d_2 |q|^2) r + ia_2 q_x + \beta_2 q = 0, \]  

where \( t \) and \( x \) account for time in dimensionless form and the non-dimensional distance, respectively, while \( q(x, t) \) and \( r(x, t) \) represent the wave profiles. \( a_j, b_j, c_j, a_j, d_j, \) and \( \beta_j (j = 1, 2) \) come from the third-order dispersion, fourth-order dispersion, self-phase modulation, intermodal dispersion, cross-phase modulation, and the detuning parameters, respectively. The first terms stand for the linear temporal evolution, and \( i = \sqrt{-1}. \)
We consider the wave profiles
\[ q(x, t) = P_1(\xi)e^{i\phi(x, t)}, \] (10)
\[ r(x, t) = P_2(\xi)e^{i\phi(x, t)}, \] (11)
along with
\[ \xi = k(x - vt), \] (12)
\[ \phi(x, t) = -\kappa x + \omega t + \theta, \] (13)
where \( P_1(\xi)(l = 1, 2) \) are the soliton amplitude components, and \( \xi \) signifies the wave variable. \( v, \kappa, \omega, \theta, \) and \( \phi(x, t) \) stand for the soliton velocity, the soliton frequency, the soliton wave number, the phase constant, and the soliton phase component, respectively.

Inserting Equations (10) and (11) into Equations (8) and (9) provides us with the ancillary equations
\[ 3\chi k^2 P''_1(a_1 - 2b_1) + P_1(-k^3 a_1 + \chi b_1 + \beta_1) + k^4 b_1 P'''_1 + d_1 P_1^2 + c_1 P_3 + P_1(a_1 \kappa - \omega) = 0, \] (14)
\[ k^3 P''_1(a_1 - 4b_1) + \chi^2 k P'_1(4b_1 - 3a_1) + k P'_1(a_1 - \nu) = 0, \] (15)
where \( \tilde{l} = 3 - l \). Setting \( P_2 = \chi P_1 \),

Equations (14) and (15) evolve as
\[ 3\chi k^2(a_1 - 2b_1 \kappa) P''_1 + P_1(-a_1 \chi^3 + a_1 \kappa + b_1 \chi^4 + \beta_1 \chi - \omega) + b_1 \chi k^4 P'''_1 + P_1(c_1 + \chi^2 d_1) = 0, \] (17)
\[ \chi k^3(a_1 - 4b_1 \kappa) P''_1 + (-3a_1 \chi^2 + a_1 + 4b_1 \chi^3 - \nu)k P'_1 = 0, \] (18)
with the usage of the following restrictions
\[ c_2 \chi^3 + \chi d_2 = c_1 + \chi^2 d_1, \]
\[ a_2 = 2b_2 \chi = \chi(a_1 - 2b_1 \kappa), \]
\[ b_2 = \chi b_1, \]
\[ a_2 \chi - a_2 \kappa^2 + b_2 \chi^4 + \beta_2 - \chi \omega = -a_1 \chi^3 + a_1 \kappa + b_1 \chi^4 + \beta_1 \chi - \omega. \] (19)

Equation (18) provides the velocity
\[ \nu = -3a_1 \chi \kappa^2 + a_1 + 4b_1 \chi^3, \] (20)
by virtue of the relations
\[ a_2 \chi - 3a_2 \kappa^2 + 4b_2 \chi^3 = -3a_1 \chi^2 \kappa^2 + a_1 \chi + 4b_1 \chi^2 \kappa^3, \] (21)
\[ a_l = 4b_1 \kappa, \] (22)
while Equation (17) reads as
\[ A_1 P''_1 + A_3 P_3 + A_2 P_1 + k^2 P'''_1 = 0, \] (23)
where
\[ A_1 = \frac{3\chi(a_1 \chi - 2b_1 \chi \kappa)}{b_1 \chi}, A_2 = \frac{-a_1 \chi^3 + a_1 \kappa + b_1 \chi^4 + \beta_1 \chi - \omega}{k^2 b_1 \chi}, A_3 = \frac{c_1 + \chi^2 d_1}{k^2 b_1 \chi}. \] (24)
With the usage of the balance algorithm in (23), Equation (5) becomes
\[ (P'_1)^2 = \frac{2s_2}{3} P_3^3 + s_1 P_1^2 + 2s_0 P_1 + s, \] (25)
where
\[ s_2 = (-\frac{3A_3}{10k^2})^\frac{1}{2}, s_1 = -\frac{A_1}{5k^2}, s_0 = (-\frac{A_2}{6k^2} + \frac{2A_1^2}{75k^4})(-\frac{3A_3}{10k^2})^{-\frac{1}{2}}, \]
\[ s = \frac{4A_1}{3A_3}(\frac{A_2}{6k^2} + \frac{2A_1^2}{75k^4}). \]

(26)

With the help of the criterions
\[ p = (\frac{2\xi_2}{3})^\frac{1}{2} \xi_1, \]
\[ q = \frac{2\xi^2}{3}, \]
\[ z = (-\frac{A_2}{3k^2} + \frac{4A_1^2}{75k^4})(-\frac{3A_3}{10k^2})^{-\frac{1}{2}}(-\frac{2A_1}{15k^2})^{-\frac{1}{2}}, \]
\[ z_0 = \frac{4A_1}{3A_3}(-\frac{A_2}{6k^2} + \frac{2A_1^2}{75k^4}). \]

Equation (25) becomes
\[ (p\xi_1)^2 = p^3 + z_2 p^2 + z_1 p + z_0, \]
where
\[ z_2 = A_1(-\frac{3A_3}{10k^2})^{-\frac{1}{2}}, \]
\[ z_1 = (-\frac{A_2}{3k^2} + \frac{4A_1^2}{75k^4})(-\frac{3A_3}{10k^2})^{-\frac{1}{2}}(-\frac{2A_1}{15k^2})^{-\frac{1}{2}}, \]
\[ z_0 = \frac{4A_1}{3A_3}(-\frac{A_2}{6k^2} + \frac{2A_1^2}{75k^4}). \]

We rewrite Equation (28) as
\[ \pm (\xi_1 - \xi_0) = \int \frac{dp}{\sqrt{F(p)}}, \]
where
\[ F(p) = p^3 + z_2 p^2 + z_1 p + z_0. \]

(31)

We consider the discriminant system
\[ \Delta = -27(\frac{2\xi_2}{15} + z_0 - \frac{z_1^2}{3})^2 - 4(z_1 - \frac{z_2}{3})^3, \]
\[ D_1 = z_1 - \frac{z_2}{3}. \]

(32)

**Case 1.** \( \Delta = 0, D_1 < 0, \) and \( F(p) = (p - \gamma_1)^2(p - \gamma_2). \) When \( p > \gamma_2, \) if \( \gamma_1 > \gamma_2, \) the dark and singular solitons are
\[ q = \{(-\frac{2A_3}{15k^2})^{-\frac{1}{2}}[(\gamma_1 - \gamma_2) \tanh(\frac{\sqrt{\gamma_1 - \gamma_2}}{2}((\frac{2A_3}{15k^2})^{\frac{3}{2}} \xi - \xi_0)) + \gamma_2]\} e^{i(-\omega t + \theta)}, \]
\[ q = \{(-\frac{2A_3}{15k^2})^{-\frac{1}{2}}[(\gamma_1 - \gamma_2) \coth(\frac{\sqrt{\gamma_1 - \gamma_2}}{2}((\frac{2A_3}{15k^2})^{\frac{3}{2}} \xi - \xi_0)) + \gamma_2]\} e^{i(-\omega t + \theta)}, \]
and if \( \gamma_1 < \gamma_2, \) the singular periodic solution is
\[ q = \{(-\frac{2A_3}{15k^2})^{-\frac{1}{2}}[(\gamma_2 - \gamma_1) \tan(\frac{\sqrt{\gamma_2 - \gamma_1}}{2}((\frac{2A_3}{15k^2})^{\frac{3}{2}} \xi - \xi_0)) + \gamma_2]\} e^{i(-\omega t + \theta)}, \]
where \( \gamma_1 \) and \( \gamma_2 \) are real numbers.

Figure 1 depicts the plot of a dark soliton (33). The parameter values chosen are \( \gamma_1 = 2, \)
\( \gamma_2 = 1, k = 1, A_3 = -1, a_1 = 1, x = 1, a_1 = 1, b_1 = 1, \) and \( \chi = 2. \) The dark soliton is featured as a localized intensity dip below a continuous wave background. Dark solitons are meaningful only if the background that supports the dark solitons is modulationally stable. Dark solitons are observed when the carrier wave is modulationally stable \([29,30].\)
Case 2. $\Delta = 0$, $D_1 = 0$, and $F(p) = (p - \gamma_1)^3$. The solution is

$$q = \{4((-2A_3) - \frac{1}{2} r - \xi) - 2 + \gamma_1\} e^{(-kx + \omega t + \theta)},$$

where $\gamma_1$ is a real number.

Case 3. $\Delta > 0$, $D_1 < 0$, and $F(p) = (p - \gamma_1)(p - \gamma_2)(p - \gamma_3)$. When $\gamma_1 < \gamma_2 < \gamma_3$, if $\gamma_1 < p < \gamma_2$, the solution is

$$q = \{(\frac{2A_3}{15k^2}) - \frac{1}{2} [\gamma_1 + (\gamma_2 - \gamma_1)\sin^2(\frac{\sqrt{\gamma_3 - \gamma_1}}{2})((-2A_3) - \frac{1}{2} r - \xi) - \xi_0)]\} e^{(-kx + \omega t + \theta)},

and if $p > \gamma_3$, the solution is

$$q = \{(\frac{2A_3}{15k^2}) - \frac{1}{2} [\gamma_3 - (\gamma_2 - \gamma_1)\sin^2(\frac{\sqrt{\gamma_3 - \gamma_1}}{2})((-2A_3) - \frac{1}{2} r - \xi) - \xi_0)]\} e^{(-kx + \omega t + \theta)},

where $\gamma_1$, $\gamma_2$, and $\gamma_3$ are real numbers, and $m^2 = \frac{\gamma_2 - \gamma_1}{\gamma_3 - \gamma_1}$.  

Case 4. $\Delta < 0$, and $F(p) = (p - \gamma_1)(p^2 + lp + j), l^2 - 4j < 0$. The solution is

$$q = \{(\frac{2A_3}{15k^2}) - \frac{1}{2} [\gamma_1 - \sqrt{\gamma_1^2 + lp + j} + \sqrt{\gamma_1^2 + \gamma_1 + j)}\} e^{(-kx + \omega t + \theta)},

where $\gamma_1$, $l$, and $j$ are real numbers, and $m^2 = \frac{1}{2}(1 - \frac{\gamma_1 + \frac{1}{2}}{\gamma_1 + \frac{1}{2}}).

3.2. Parabolic Law

In this case, the model evolves as

$$iq_t + ia_1 r_{xxx} + b_1 r_{xxxx} + (c_1 |q|^2 + d_1 |r|^2)q + (\xi_1 |q|^4 + \eta_1 |q|^2 |r|^2 + \xi_1 |r|^4)q + ia_1 q_x + \beta_1 r = 0,$$

$$ir_t + ia_2 q_{xxx} + b_2 q_{xxxx} + (c_2 |r|^2 + d_2 |q|^2)r + (\xi_2 |r|^4 + \eta_2 |r|^2 |q|^2 + \xi_2 |q|^4)r + ia_2 r_x + \beta_2 q = 0.$$
Substituting Equations (10) and (11) into Equations (40) and (41) provides us with the equations
\[
3k^2 P''_1 (\kappa_1 P''_1 - 2\kappa^2 b_1) + P_2 (-\kappa^3 a_1 P_1 + \kappa^4 b_1 P_1 + \beta_1) + k^4 b_1 P'''_1 \\
+ P_3^2 (\eta_1 P_1^2 + c_1) + P_1 (d_1 P_1 + \zeta_1 P_1^3 + \kappa a_1 - \omega) + \xi_1 P_1^5 = 0, \tag{42}
\]
\[
k^3 P'''_1 (a_1 - 4\kappa b_1) + P'_1 \left(4\kappa^3 k b_1 - 3\kappa^2 k a_1\right) + k P'_1 (a_1 - \nu) = 0. \tag{43}
\]
Taking
\[
P_2 = \chi P_1, \tag{44}
\]
Equations (42) and (43) turn into
\[
k^2 P''_1 (3a_1 \chi - 6b_1 \chi^2) + P_1 (-a_1 \chi^3 + a_1 \kappa + b_1 \chi^4 + \beta_1 \chi - \omega) \\
+ b_1 \chi^4 P''_1 + P_3^2 (c_1 + \chi^2 d_1) + P_1^3 (\chi^4 \zeta_1 + \chi^2 \eta_1 + \zeta_1) = 0, \tag{45}
\]
and
\[
k^2 P'''_1 (a_1 \chi - 4b_1 \chi^2) + P'_1 (-3a_1 \chi^3 + 4b_1 \chi^3 + (a_1 - \nu)) = 0, \tag{46}
\]
along with the constraints
\[
c_1 + \chi^2 d_1 = \chi (c_2 \chi^2 + d_2), \\
- a_1 \chi^3 + a_1 \kappa + b_1 \chi^4 + \beta_1 \chi - \omega = a_2 \chi^2 - a_2 \chi^3 + b_2 \chi^4 + \beta_2 - \chi \omega, \\
\chi^4 \zeta_1 + \chi^2 \eta_1 + \zeta_1 = \chi P_1^3 (\chi^4 \xi_1 + \chi^2 \eta_1 + \zeta_1), \\
\chi (a_1 \kappa - 2b_1 \kappa^2) = a_2 \kappa - 2b_2 \kappa^2, \\
b_1 \chi = b_2.
\]
Equation (46) yields the velocity
\[
\nu = -3a_1 \chi^2 + a_1 + 4b_1 \chi \kappa^3, \tag{48}
\]
with the aid of the restrictions
\[
a_2 \chi - 3a_2 \chi^2 + 4b_2 \chi^3 = -3a_1 \chi^2 - a_1 \chi + 4b_1 \chi^2 \kappa^3, \tag{49}
\]
\[
a_1 = 4b_1 \kappa, \tag{50}
\]
while Equation (45) becomes
\[
A_1 P''_1 + A_4 P^5_1 + A_3 P^3_1 + A_2 P_1 + k^2 P'''_1 = 0, \tag{51}
\]
where
\[
A_1 = \frac{3a_1 \chi \kappa - 6b_1 \chi^2}{b_1 \chi}, A_2 = \frac{-a_1 \chi^3 + a_1 \kappa + b_1 \chi^4 + \beta_1 \chi - \omega}{b_1 \chi k^2}, \\
A_3 = \frac{c_1 + \chi^2 d_1}{b_1 \chi k^2}, A_4 = \frac{\chi^4 \zeta_1 + \chi^2 \eta_1 + \zeta_1}{b_1 \chi k^2}. \tag{52}
\]
With the usage of the balance procedure in (51), Equation (5) becomes
\[
(P'_1)^2 = \frac{s_3}{2} P^4_1 + \frac{2s_2}{3} P^3_1 + s_1 P^2_1 + 2s_0 P_1 + s, \tag{53}
\]
where
\[ s_3 = \left( -\frac{A_4}{6k^2} \right)^{\frac{1}{2}}, \]
\[ s_2 = 0, \]
\[ s_1 = -\frac{A_3}{10k^2} \left( -\frac{A_4}{6k^2} \right)^{-\frac{1}{2}} - \frac{A_1}{10k^2}, \]
\[ s_0 = 0, \]
\[ s = \left( -\frac{A_3}{10} \right) \left( -\frac{A_4}{6k^2} \right)^{-\frac{1}{2}} + \frac{9A_1}{10} \left( -\frac{A_4}{6k^2} \right)^{-\frac{1}{2}} - \frac{A_1}{10k^2} \left( -\frac{A_4}{6k^2} \right)^{-\frac{1}{2}} \left( -\frac{A_4}{6k^2} \right)^{-\frac{1}{2}}. \] (54)

With the help of the relations
\[ g = (2s_3)^{\frac{1}{2}} p^2, \]
\[ \xi_1 = \left( 2s_3 \right)^{\frac{1}{2}} \xi, \] (55)

Equation (53) is
\[ (g_{\xi_1})^2 = g^3 + \epsilon_2 g^2 + \epsilon_1 g, \] (56)

where
\[ \epsilon_2 = \left( -\frac{2A_3}{5k^2} \right)^{\frac{1}{2}} - \frac{2A_1}{5k^2}, \]
\[ \epsilon_1 = \left( -\frac{2A_3}{10} \right)^{-\frac{1}{2}} + \frac{9A_1}{10} \left( -\frac{A_4}{6k^2} \right)^{-\frac{1}{2}} - \frac{A_1}{15k^2} \left( -\frac{A_4}{6k^2} \right)^{-\frac{1}{2}} - \frac{2A_2}{3k^2} \left( -\frac{A_4}{6k^2} \right)^{-\frac{1}{2}} \left( -\frac{A_4}{6k^2} \right)^{-\frac{1}{2}}. \] (57)

We rewrite Equation (56) as
\[ \pm (\xi_1 - \xi_0) = \int \frac{dg}{\sqrt{F(g)}}, \] (58)

where
\[ F(g) = g(g^2 + \epsilon_2 g + \epsilon_1). \] (59)

We consider the discriminant system
\[ \Delta = \epsilon_2^2 - 4\epsilon_1. \] (60)

**Case 1.** \( \Delta = 0 \). For \( g > 0 \), if \( \epsilon_2 < 0 \), we have the dark and singular solitons
\[ q = \left( -\frac{2A_4}{3k^2} \right)^{-\frac{1}{2}} \left( \frac{\epsilon_2}{2} - \frac{1}{2} \right) \tan\left( \frac{1}{2} \sqrt{-\frac{\epsilon_2}{2}} \right) \left( \left( -\frac{2A_4}{3k^2} \right)^{\frac{1}{2}} \xi - \xi_0 \right) \right)^{\frac{1}{2}} e^{i(\kappa x + \omega t + \theta)}, \] (61)

\[ q = \left( -\frac{2A_4}{3k^2} \right)^{-\frac{1}{2}} \left( \frac{\epsilon_2}{2} - \frac{1}{2} \right) \coth\left( \frac{1}{2} \sqrt{-\frac{\epsilon_2}{2}} \right) \left( \left( -\frac{2A_4}{3k^2} \right)^{\frac{1}{2}} \xi - \xi_0 \right) \right)^{\frac{1}{2}} e^{i(\kappa x + \omega t + \theta)}, \] (62)

if \( \epsilon_2 > 0 \), we have the singular periodic solution
\[ q = \left( -\frac{2A_4}{3k^2} \right)^{-\frac{1}{2}} \left( \frac{\epsilon_2}{2} \tan\left( \frac{1}{2} \sqrt{\frac{\epsilon_2}{2}} \right) \left( \left( -\frac{2A_4}{3k^2} \right)^{\frac{1}{2}} \xi - \xi_0 \right) \right) \right)^{\frac{1}{2}} e^{i(\kappa x + \omega t + \theta)}; \] (63)

if \( \epsilon_2 = 0 \), we have the solution
\[ q = \frac{4 \left( -\frac{2A_4}{3k^2} \right)^{-\frac{1}{2}} \left( \left( -\frac{2A_4}{3k^2} \right)^{\frac{1}{2}} \xi - \xi_0 \right) \right)^{\frac{1}{2}} e^{i(\kappa x + \omega t + \theta)}. \] (64)

Figure 2 depicts the plot of a singular soliton (62). The parameter values chosen are \( \epsilon_2 = -1, k = 1, A_4 = -1, a_1 = 1, k = 1, a_1 = 1, b_1 = 1, \) and \( \chi = 2 \).
**Case 4.** If \( \Delta < 0 \), then we have

\[
q = \left\{ (-\frac{2A_4}{3k^2})^{-\frac{1}{2}} \left( \frac{c_2}{2} \tan\left( \frac{1}{2} \sqrt{\frac{c_2}{2}} (-\frac{2A_4}{3k^2}) \xi - \xi_0 \right) \right) \right\}^2 e^{i(-\omega t + \theta)},
\]

where \( m^2 = \frac{c_2}{2} \).
3.3. Polynomial Law

In this case, the model reads as

\[ i q_t + ia_1 r_{xxx} + b_1 r_{xxxx} + (c_1 |q|^2 + d_1 |r|^2)q + (\xi_1 |q|^4 + \eta_1 |q|^2 |r|^2 + \zeta_1 |r|^4)q + (l_1 |q|^6 + m_1 |q|^4 |r|^2 + n_1 |q|^2 |r|^4 + p_1 |r|^6)q + i\alpha_1 q_x + \beta_1 r = 0, \]

(71)

\[ i r_t + ia_2 q_{xxx} + b_2 q_{xxxx} + (c_2 |r|^2 + d_2 |q|^2) r + (\xi_2 |q|^4 + \eta_2 |q|^2 |r|^2 + \zeta_2 |q|^4) r + (l_2 |r|^6 + m_2 |q|^4 |q|^2 + n_2 |q|^2 |r|^4 + p_2 |q|^6) r + i\alpha_2 q_x + \beta_2 q = 0. \]

(72)

Putting Equations (10) and (11) into Equations (71) and (72) provides us with the ancillary equations

\[ 3\kappa k^2 a_1 P''_1 - \kappa^3 a_1 P_1 + k^4 b_1 P'''_1 - 6\kappa^2 k^2 b_1 P''_1 + k^4 b_1 P'_1 + P^3_1 (n_1 P_1^4 + \eta_1 P_1^2 + c_1) + P_1 (d_1 P^2_1 + p_1 P^2_1 + \xi_1 P_1^2 + \kappa a_1 - \omega) + P^5_1 (m_1 P_1^2 + \zeta_1) + \beta_1 P_1 + l_1 P'_1 = 0, \]

(73)

\[ k^3 P'''_1 (a_1 - 4\kappa b_1) + k P'_1 (4k^3 b_1 - 3\kappa^2 a_1) + k P'_1 (a_1 - v) = 0. \]

(74)

Setting

\[ P_2 = \chi P_1, \]

(75)

Equations (73) and (74) becomes

\[ \chi k^2 P''_1 (3a_1 \chi - 6 b_1 k^2) + P_1 (-a_1 \chi^3 + a_1 \chi + b_1 \chi^4 + \beta_1 \chi - \omega) + b_1 \chi k^4 P'''_1 + P_1 (c_1 + \chi^2 d_1) + P_1^2 (l_1 + \chi^2 m_1 + \chi^4 n_1 + \chi^6 p_1) + P_1^5 (\chi^4 \xi_1 + \chi^2 \eta_1 + \zeta_1) = 0, \]

(76)

\[ k^2 P'''_1 (a_1 \chi - 4 b_1 \chi^3) + P'_1 (-3 a_1 \chi^2 + 4 b_1 \chi^3 + (a_1 - v)) = 0, \]

(77)

together with the conditions

\[ c_1 + \chi^2 d_1 = \chi (c_2 \chi^2 + d_2), \]

\[ l_1 + \chi^2 m_1 + \chi^4 n_1 + \chi^6 p_1 = \chi (c_2 \chi^2 + \chi^4 m_2 + \chi^2 n_2 + p_2), \]

\[ -a_1 \chi \chi^3 + a_1 \chi + b_1 \chi^4 + \beta_1 \chi - \omega = a_2 \chi \chi - a_2 \chi^3 + b_2 \chi^4 + \beta_2 - \chi \omega, \]

\[ \chi \xi_1 + \chi^2 \eta_1 + \zeta_1 = \chi (\chi \xi_2 + \chi^2 \eta_2 + \zeta_2), \]

\[ \chi \xi_1 + \chi^2 \eta_1 + \zeta_1 = \chi (\chi \xi_2 + \chi^2 \eta_2 + \zeta_2), \]

\[ \chi (a_1 \chi - 2 b_1 k^2) = a_2 \chi - 2 b_2 k^2, \]

\[ b_1 \chi = b_2. \]

Equation (77) gives way to the velocity

\[ v = -3 a_1 \chi^2 + a_1 + 4 b_1 \chi^3, \]

(79)

with the aid of the constraints

\[ a_2 \chi - 3 a_2 k^2 + 4 b_2 k^2 = -3 a_1 \chi^2 k^2 + a_1 \chi + 4 b_1 \chi^2 k^3, \]

(80)

\[ a_1 = 4 b_1 k, \]

(81)

while Equation (76) becomes

\[ A_1 P''_1 + A_3 P''_1 + A_4 P''_1 + A_5 P^3_1 + A_2 P_1 + k^2 P'''_1 = 0, \]

(82)
where

\[ A_1 = \frac{\chi(3a_1\chi - 6b_1\chi^2)}{b_1\chi}, \quad A_2 = -\frac{a_1\chi^3 + a_1\chi + b_1\chi^4 + \beta_1\chi - \omega}{b_1\chi^2}, \quad A_3 = \frac{c_1 + \chi^2d_1}{b_1\chi^2}, \]
\[ A_4 = \frac{\chi^4c_1 + \chi^2\eta_1 + \xi_1}{b_1\chi^2}, \quad A_5 = \frac{\chi^4m_1 + \chi^4n_1 + \chi^6p_1}{b_1\chi^2}. \]  

(83)

With the help of the balance technique in (82), Equation (5) simplifies to

\[ (p_1')^2 = \frac{2s_4}{5} p_1^5 + \frac{s_3}{2} p_1^4 + \frac{2s_2}{3} p_1^3 + s_1 p_1^2 + 2s_0 p_1 + s, \]  

(84)

where

\[ s_4 = \left( -\frac{5A_5}{44k^2} \right)^\frac{1}{4}, s_3 = 0, s_2 = -\frac{A_4}{74k^2} \left( -\frac{5A_5}{44k^2} \right)^{-\frac{1}{4}}, s_1 = -\frac{A_1}{17k^2}, \]
\[ s_0 = -\frac{A_3}{28k^2} \left( -\frac{5A_5}{44k^2} \right)^{-\frac{1}{4}} - \frac{125A_4^2}{229992k^4} \left( -\frac{5A_5}{44k^2} \right)^{-\frac{3}{2}}, s = \frac{14652A_1A_2}{209457A_5}. \]  

(85)

By the aid of the criterions

\[ f = \left( \frac{2s_4}{5} \right)^\frac{1}{4} p_1, \xi_1 = \left( \frac{2s_4}{5} \right)^{\frac{1}{4}} \xi, \]

(86)

Equation (84) becomes

\[ (f_1')^2 = f^3 + y_3 f^3 + y_2 f^2 + y_1 f + y_0, \]  

(87)

where

\[ y_3 = -\left( \frac{2}{5} \right)^{-\frac{3}{5}} \frac{15A_4}{222k^2} \left( -\frac{5A_5}{44k^2} \right)^{-\frac{1}{4}}, y_2 = -\frac{A_1}{17k^2} \left( -\frac{5A_5}{44k^2} \right)^{-\frac{1}{4}}, \]
\[ y_1 = -\left( \frac{2}{5} \right)^{-\frac{3}{5}} \frac{A_3}{14k^2} \left( -\frac{5A_5}{44k^2} \right)^{-\frac{3}{4}} + \frac{125A_4^2}{114996k^4} \left( -\frac{5A_5}{44k^2} \right)^{-\frac{5}{2}}, y_0 = h. \]

(88)

We rewrite Equation (87) as

\[ \pm (\xi_1 - \xi_0) = \int \frac{df}{\sqrt{F(f)}}, \]  

(89)

where

\[ F(f) = f^3 + y_3 f^3 + y_2 f^2 + y_1 f + y_0. \]  

(90)

We consider the discriminant system

\[ D_2 = -y_3, \]
\[ D_3 = 40y_1y_3 - 12y_3^3 - 45y_2^2, \]
\[ D_4 = 12y_3^2y_1 - 4y_3^2y_2 + 117y_3y_1y_2^2 - 88y_1^2y_3 - 40y_2y_0y_3^2 - 27y_2^4 - 300y_2y_1y_0 + 160y_1^3, \]
\[ D_5 = -1600y_2y_0y_3^2 - 3750y_3y_2y_0^2 + 2000y_3y_1y_2^2 - 4y_3y_2^2y_1^2 + 16y_3^2y_2y_0 - 900y_1y_0y_3^2 + 825y_3y_2^2y_0^2 + 144y_3y_2^2y_1^2 + 2250y_1y_2y_0^2 + 16y_3^2y_1^2 - 128y_1y_2y_0^2 - 27y_2^2y_1^2 + 108y_0y_2^2 + 256y_1^2 \]
\[ + 3125y_0^4 - 72y_1y_0y_2^3 + 560y_0y_2y_1y_3^2 - 630y_3y_1y_0y_2^2, \]
\[ E_2 = 160y_3^2y_1^3 + 900y_2y_1^3 - 48y_3^2y_2^2 + 60y_1y_3^2y_2^2 + 1500y_3y_2y_1y_0 + 16y_3^2y_1^3 - 1100y_2y_0y_3^2 + 625y_3y_2^2 - 3375y_0y_2^2, \]
\[ E_2 = 3y_2^2 - 8y_1y_3. \]  

(91)
Case 1. \(D_3 = 0, D_4 = 0, D_3 > 0, E_2 \neq 0\), and \(F(f) = (f - \delta_1)^2(f - \delta_2)^2(f - \delta_3)\). When \(f > \delta_3\), if \(\delta_3 > \delta_1, \delta_3 > \delta_2\), we obtain

\[
\pm (\pm \frac{A_5}{55k^2})m \xi - \zeta_0 = \frac{2}{\delta_1 - \delta_2} (\sqrt{\delta_3 - \delta_1} \arctan \sqrt{\frac{\pm P_1 - \delta_3}{\sqrt{\delta_3 - \delta_1}}} - \sqrt{\delta_3 - \delta_2} \arctan \sqrt{\frac{\pm P_1 - \delta_3}{\sqrt{\delta_3 - \delta_2}}})
\]

if \(\delta_3 > \delta_1, \delta_3 < \delta_2\), we obtain

\[
\pm (\pm \frac{A_5}{55k^2})m \xi - \zeta_0 = \frac{2}{\delta_1 - \delta_2} (\sqrt{\delta_3 - \delta_1} \arctan \sqrt{\frac{\pm P_1 - \delta_3}{\sqrt{\delta_3 - \delta_1}}} - \frac{1}{\sqrt{\delta_2 - \delta_3}} \ln \left| \frac{\sqrt{\frac{\pm P_1 - \delta_3}{\sqrt{\delta_3 - \delta_2}}}}{\sqrt{\frac{\pm P_1 - \delta_3}{\sqrt{\delta_3 - \delta_1}}}} \right|)
\]

if \(\delta_3 < \delta_1, \delta_3 > \delta_2\), we obtain

\[
\pm (\pm \frac{A_5}{55k^2})m \xi - \zeta_0 = \frac{2}{\delta_1 - \delta_2} (-\sqrt{\delta_3 - \delta_2} \arctan \sqrt{\frac{\pm P_1 - \delta_3}{\sqrt{\delta_3 - \delta_2}}} + \frac{1}{2\sqrt{\delta_1 - \delta_3}} \ln \left| \frac{\sqrt{\frac{\pm P_1 - \delta_3}{\sqrt{\delta_3 - \delta_2}}}}{\sqrt{\frac{\pm P_1 - \delta_3}{\sqrt{\delta_3 - \delta_1}}}} \right|)
\]

if \(\delta_3 < \delta_1, \delta_3 < \delta_2\), we obtain

\[
\pm (\pm \frac{A_5}{55k^2})m \xi - \zeta_0 = \frac{2}{\delta_1 - \delta_2} (\frac{1}{2\sqrt{\delta_1 - \delta_3}} \ln \left| \frac{\sqrt{\frac{\pm P_1 - \delta_3}{\sqrt{\delta_3 - \delta_2}}}}{\sqrt{\frac{\pm P_1 - \delta_3}{\sqrt{\delta_3 - \delta_1}}}} \right| - \frac{1}{2\sqrt{\delta_2 - \delta_3}} \ln \left| \frac{\sqrt{\frac{\pm P_1 - \delta_3}{\sqrt{\delta_3 - \delta_2}}}}{\sqrt{\frac{\pm P_1 - \delta_3}{\sqrt{\delta_3 - \delta_1}}}} \right|)
\]

where \(\delta_1, \delta_2, \text{and} \delta_3\) are real numbers.

Case 2. \(D_3 = 0, D_4 = 0, D_3 = 0, D_2 \neq 0, E_2 \neq 0\), and \(F(f) = (f - \delta_1)^3(f - \delta_2)^2\). When \(f > \delta_1\), if \(\delta_1 > \delta_2\), we obtain

\[
\pm (\pm \frac{A_5}{55k^2})m \xi - \zeta_0 = \frac{2}{\delta_1 - \delta_2} (-\frac{1}{\sqrt{\frac{\pm P_1 - \delta_3}{\sqrt{\delta_3 - \delta_1}}}} - \sqrt{\delta_1 - \delta_2} \arctan \sqrt{\frac{\pm P_1 - \delta_1}{\sqrt{\delta_1 - \delta_2}}})
\]

if \(\delta_1 < \delta_2\), we obtain

\[
\pm (\pm \frac{A_5}{55k^2})m \xi - \zeta_0 = \frac{2}{\delta_1 - \delta_2} (-\frac{1}{\sqrt{\frac{\pm P_1 - \delta_3}{\sqrt{\delta_3 - \delta_1}}}} - \frac{1}{2\sqrt{\delta_2 - \delta_1}} \ln \left| \frac{\sqrt{\frac{\pm P_1 - \delta_3}{\sqrt{\delta_3 - \delta_2}}}}{\sqrt{\frac{\pm P_1 - \delta_3}{\sqrt{\delta_3 - \delta_1}}}} \right|)
\]
where $\delta_1$ and $\delta_2$ are real numbers.

**Case 3.** $D_5 = 0$, $D_4 = 0$, $D_3 = 0$, $D_2 \neq 0$, $F_2 = 0$, and we have $F(f) = (f - \delta_1)^4(f - \delta_2)$. When $f > \delta_1$, if $\delta_1 < \delta_2$, we obtain

\[
\pm \left( -\frac{A_5}{5k^2} \frac{1}{m} \xi - \xi_0 \right) = \frac{2}{\delta_1 - \delta_2} \left( -\frac{\sqrt{\frac{A_5}{5k^2}} \frac{1}{m} P_1 - \delta_2}{2\left( -\frac{\sqrt{\frac{A_5}{5k^2}} \frac{1}{m} P_1 - \delta_1 \right)} \right. \\
\left. - \frac{1}{2\sqrt{\delta_1 - \delta_2}} \arctan \left( \frac{\sqrt{\frac{A_5}{5k^2}} \frac{1}{m} \delta - \delta_2}{\sqrt{\delta_2 - \delta_1}} \right) \right) 
\]  

(98)

if $\delta_1 > \delta_2$, we obtain

\[
\pm \left( -\frac{A_5}{5k^2} \frac{1}{m} \xi - \xi_0 \right) = \frac{2}{\delta_1 - \delta_2} \left( -\frac{\sqrt{\frac{A_5}{5k^2}} \frac{1}{m} P_1 - \delta_2}{2\left( -\frac{\sqrt{\frac{A_5}{5k^2}} \frac{1}{m} P_1 - \delta_1 \right)} \right. \\
\left. - \frac{1}{4\sqrt{\delta_1 - \delta_2}} \ln \left| \frac{\sqrt{\frac{A_5}{5k^2}} \frac{1}{m} P_1 - \delta_2 - \sqrt{\delta_1 - \delta_2}}{\sqrt{\frac{A_5}{5k^2}} \frac{1}{m} P_1 - \delta_2 + \sqrt{\delta_1 - \delta_2}} \right| \right) 
\]  

(99)

where $\delta_1$ and $\delta_2$ are real numbers.

**Case 4.** $D_5 = 0$, $D_4 = 0$, $D_3 = 0$, $D_2 = 0$, and $F(f) = (f - \delta_1)^5$. When $f > \delta_1$, we obtain

\[
P_1 = \left\{ -\frac{A_5}{5k^2} \frac{1}{m} \left[ \sqrt{\left( \frac{3}{2} \left( -\frac{A_5}{5k^2} \frac{1}{m} \xi - \xi_0 \right) - \frac{1}{2} \delta + \delta_1 \right)^2} \right] \right\} 
\]  

(100)

where $\delta_1$ is a real number.

**Case 5.** $D_5 = 0$, $D_4 = 0$, $D_3 < 0$, $E_2 \neq 0$, and $F(f) = (f - \delta_1)(f^2 + mf + n)^2$. When $f > \delta_1$, we obtain

\[
\pm \left( -\frac{A_5}{5k^2} \frac{1}{m} \xi - \xi_0 \right) = -\frac{2}{\sqrt{4n - m^2}} \cos \psi \arctan \left( \frac{2\sigma \sin \psi \sqrt{\left(-\frac{A_5}{5k^2}\right) \frac{1}{m} P_1 - \delta_1}}{\left(-\frac{A_5}{5k^2}\right) \frac{1}{m} P_1 - \delta_1 - \sigma^2} \right) \\
+ \sin \psi \frac{1}{2} \frac{2\sigma \sin \psi \sqrt{\left(-\frac{A_5}{5k^2}\right) \frac{1}{m} P_1 - \delta_1 - \sigma^2 - 2\sigma \cos \psi \sqrt{\left(-\frac{A_5}{5k^2}\right) \frac{1}{m} P_1 - \delta_1}}}{\left(-\frac{A_5}{5k^2}\right) \frac{1}{m} P_1 - \delta_1 - \sigma^2 + 2\sigma \cos \psi \sqrt{\left(-\frac{A_5}{5k^2}\right) \frac{1}{m} P_1 - \delta_1}} 
\]  

(101)

where $\delta_1$ is a real number, $m^2 - 4n < 0$, $\sigma = \left( \delta_2^2 + m\delta_1 + n \right)^{\frac{1}{2}}$, and $\psi = \frac{1}{2} \arctan \frac{\sqrt{4n - m^2}}{-2\delta_1 - m}$.

**Case 6.** $D_5 = 0$, $D_4 > 0$, and $F(f) = (f - \delta_1)^2(f - \delta_2)(f - \delta_3)(f - \delta_4)$. When $\delta_2 > \delta_3 > \delta_4$, we obtain

\[
\pm \left( -\frac{A_5}{5k^2} \frac{1}{m} \xi - \xi_0 \right) = \frac{2}{(\delta_1 - \delta_3)\sqrt{\delta_3 - \delta_4}} \{ F(\psi, k) - \frac{\delta_2 - \delta_3}{\delta_2 - \delta_1} \Pi(\psi, \frac{\delta_2 - \delta_3}{\delta_2 - \delta_1}, k) \} 
\]  

(102)

where $\delta_1$, $\delta_2$, $\delta_3$, and $\delta_4$ are real numbers, and $\delta_2 > \delta_3 > \delta_4$, $F(\psi, k) = \int_0^\psi \frac{d\psi}{\sqrt{1 - k^2 \sin^2 \varphi}}$, and

\[
\Pi(\psi, n, k) = \int_0^\psi \frac{d\varphi}{(1 + n \sin^2 \varphi)^{\frac{1}{2} - k}} \sin \varphi. 
\]  

**Case 7.** $D_5 = 0$, $D_4 = 0$, $D_3 < 0$, $E_2 = 0$, and $F(f) = (f - \delta_1)^2((f - \delta_2)^2 + \delta_2^3)$. When $f > \delta_1$, if $\delta_1 \neq \delta_2 + \delta_3$, we obtain
\[ \pm \left( \frac{A_s}{5k^2} \right)^{1/2} \eta - \xi_0 = \sqrt{\frac{\sin^3 2\theta}{4\delta_3^2}} \left( \frac{\sqrt{2}}{k} \right) \arcsin(k \sin \psi) - F(\psi, k) \right); \]

where \( \delta_1, \delta_2, \) and \( \delta_3 \) are real numbers, \( \tan 2\theta = \frac{\delta_1}{\sqrt{\delta_1^2 - \delta_2^2}}, k = \sin(0 \leq \theta < \frac{\pi}{2}), \) and \( E(\psi, k) = \int_0^\psi \sqrt{1 - k^2 \sin^2 \psi} \, d\psi. \)

**Case 8.** \( D_3 = 0, D_4 < 0, \) and \( F(f) = (f - \delta_1)^2(f - \delta_2)((f - \delta_3)^2 + \delta_4^2). \) When \( f > \delta_2, \)

\[ \pm \left( \frac{A_s}{5k^2} \right)^{1/2} \eta - \xi_0 = \sqrt{\frac{\sin^3 2\theta}{4\delta_4^2}} \left( \frac{\sqrt{2}}{k} \right) \arcsin(k \sin \psi) - F(\psi, k) \right); \]

if \( \delta_1 = \delta_3 - \delta_4 \tan \theta, \delta_1 = \delta_3 + \delta_4 \cot \theta, \) we obtain

**3.4. Quadratic–Cubic Law**

In this case, the model is

\[ iq + ia_1r_{xxx} + b_1r_{xxxx} + c_1q \sqrt{|q|^2 + |r|^2 + qr + q^*r + (d_1|q|^2 + f_1|r|^2)q + p_1 r^2 q^* + ia_2q + \beta_1 r = 0,} \]

\[ ir_i + ia_2q_{xxx} + b_2q_{xxxx} + c_2q \sqrt{|r|^2 + q^2 + qr + q^*r + (d_2|r|^2 + f_2|q|^2)r + p_2 q^2 r^* + ia_{xx} + \beta_2 q = 0.} \]

Putting Equations (10) and (11) into Equations (108) and (109) provides us with the auxiliary equations

\[ 3k^2 P''(\kappa a_l - 2k^2 b_l) + P_l(\kappa^3 a_{l1} + \kappa^4 b_{l1} + \beta_{l1}) + k^4 b_l P''' \]

\[ + P_l(c_1 P_l + P_l) + f_1 P_l^2 + p_1 P_l^2 + ak - \omega_l) + d_l P_l^3 = 0, \]

\[ k^3 P'''(a_l - 4k b_l) + k P_l^2 (4k^3 b_l - 3k^2 a_l) + k(a - v) P_l^2 = 0. \]
Taking \( P_2 = \chi P_1 \),

Equations (110) and (111) become

\[
3\chi k^2 P''_1 (a_1 - 2b_1\chi) + P_1 (-a_1\chi^3 + ax) + b_1\chi^4 + \beta_1\chi - \omega) + b_1\chi k^2 P''''_1 + (\chi + 1)c_1 P^2_1 + P^3_1 (d_1 + \chi^2 f_1 + \chi^2 p_1) = 0, \tag{113}
\]

\[
\chi k^2 P''_1 (a_1 - 4b_1\chi) + P'_1 (-3a_1\chi^2 + 4b_1\chi^3 + (a - \nu)) = 0, \tag{114}
\]

by virtue of the restrictions

\[
c_1 = \chi c_2, \\
d_1 + \chi^2 f_1 + \chi^2 p_1 = \chi^3 d_2 + \chi f_2 + \chi p_2, \\
-a_1\chi k^3 + ax + b_1\chi^4 + \beta_1\chi - \omega = a\chi^3 - a_2\chi^3 + b_2\chi^4 + \beta_2 - \chi\omega, \tag{115}
\]

\[
\chi (a_1 - 2b_1\chi) = a_2 - 2b_2\chi, \\
b_1\chi = b_2.
\]

Equation (114) exposes the velocity

\[
v = -3a_1\chi^2 + a_1 + 4b_1\chi^3, \tag{116}
\]

along with the constraints

\[
a_2\chi - 3a_2\chi^2 + 4b_2\chi^3 = -3a_1\chi^2 + a_1\chi + 4b_1\chi^3, \tag{117}
\]

\[
a_1 = 4b_1\chi, \tag{118}
\]

while Equation (113) becomes

\[
A_1 P''_1 + A_3 P^3_1 + A_4 P^2_1 + A_2 P_1 + k^2 P''''_1 = 0, \tag{119}
\]

where

\[
A_1 = \frac{3\chi k^2 (a_1 - 2b_1\chi)}{b_1\chi k^2}, A_2 = \frac{-a_1\chi^3 + ax + b_1\chi^4 + \beta_1\chi - \omega}{b_1\chi k^2}, \\
A_3 = \frac{d_1 + \chi^2 f_1 + \chi^2 p_1}{b_1\chi k^2}, A_4 = \frac{(\chi + 1)c_1}{b_1\chi k^2}.
\tag{120}
\]

By virtue of the balance procedure in (119), Equation (5) becomes

\[
(P'_1)^2 = \frac{2s_2}{3} P^3_1 + s_1 P^2_1 + 2s_0 P_1 + s, \tag{121}
\]

where

\[
s_2 = \left( \frac{3A_3}{10k^2} \right)^\frac{1}{2}, s_1 = \frac{A_1}{5k^2} - \frac{A_4}{5k^2} \left( \frac{3A_3}{10k^2} \right)^{-\frac{1}{2}}, \\
s_0 = \left( \frac{2A_1^2}{75k^4} - \frac{A_2^2}{6k^2} + \frac{A_4^2}{45k^2 A_3} + \frac{A_1 A_4}{50k^4} \left( \frac{3A_3}{10k^2} \right)^{-\frac{1}{2}} \right) \left( \frac{3A_3}{10k^2} \right)^{-\frac{1}{2}}, \\
s = \frac{4A_1}{3A_3} - \frac{A_4}{3A_3} \left( \frac{3A_3}{10k^2} \right)^{-\frac{1}{2}} \left( \frac{2A_1^2}{75k^4} - \frac{A_2^2}{6k^2} + \frac{A_4^2}{45k^2 A_3} + \frac{A_1 A_4}{50k^4} \left( \frac{3A_3}{10k^2} \right)^{-\frac{1}{2}} \right).
\tag{122}
\]

We rewrite Equation (121) as

\[
\pm \left( \frac{2A_3}{15k^2} \right)^{\frac{1}{2}} (\xi_1 - \xi_0) = \int \frac{dP_1}{\sqrt{F(P_1)}}, \tag{123}
\]
where

\[ F(P_1) = P_1^3 + j_2 P_1^2 + j_1 P_1 + j_0, \]  
\[ (124) \]

and

\[ j_2 = -\frac{3A_1}{10k^2} \left( -\frac{3A_3}{10k^2} \right)^{-\frac{1}{2}} + \frac{A_4}{A_3}, \]
\[ j_1 = -\frac{10k^2}{A_3} \left( \frac{2A_1^2}{75k^4} \right) - \frac{A_2}{6k^2} + \frac{A_2^2}{45k^2 A_3} + \frac{A_1 A_4}{50k^4} \left( -\frac{3A_3}{10k^2} \right)^{-\frac{1}{2}}, \]
\[ j_0 = \left( \frac{2A_1}{A_3} \left( -\frac{3A_3}{10k^2} \right)^{-\frac{1}{2}} + \frac{10k^2 A_4}{6A_3^2} \right) \left( \frac{2A_1^2}{75k^4} - \frac{A_2}{6k^2} + \frac{A_2^2}{45k^2 A_3} + \frac{A_1 A_4}{50k^4} \left( -\frac{3A_3}{10k^2} \right)^{-\frac{1}{2}} \right). \]

We consider the discriminant system

\[ \Delta = -27(\frac{2j_0}{3} + j_1 j_2)^2 - 4(j_1 - \frac{j_0^2}{3})^3, D_1 = j_1 - \frac{j_0^2}{3}, \]
\[ (126) \]

**Case 1.** \( \Delta = 0, D_1 < 0, \) and \( F(P_1) = (P_1 - t_1)^2 (P_1 - t_2). \) When \( P_1 > t_2, \) if \( t_1 > t_2, \) the dark and singular solitons are

\[ q = \left[ (t_1 - t_2) \tanh^2 \left( \frac{\sqrt{t_1 - t_2}}{2} \right) \left( -\frac{2A_3}{15k^2} \right)^{\frac{1}{2}} (\xi_1 - \xi_0) + t_2 \right] e^{i(-\kappa x + \omega t + \theta)}, \]
\[ (127) \]

and if \( t_1 < t_2, \) the singular periodic solution is

\[ q = \left[ (t_2 - t_1) \tanh^2 \left( \frac{\sqrt{t_2 - t_1}}{2} \right) \left( -\frac{2A_3}{15k^2} \right)^{\frac{1}{2}} (\xi_1 - \xi_0) + t_2 \right] e^{i(-\kappa x + \omega t + \theta)}, \]
\[ (128) \]

where \( t_1 \) and \( t_2 \) are real numbers.

**Case 2.** \( \Delta = 0, D_1 = 0, \) and \( F(P_1) = (P_1 - t_1)^3. \) The solution is

\[ q = \left[ 4 \left( -\frac{2A_3}{15k^2} \right)^{\frac{1}{2}} (\xi_1 - \xi_0)^{-2} + t_1 \right] e^{i(-\kappa x + \omega t + \theta)}, \]
\[ (130) \]

where \( t_1 \) is a real number.

**Case 3.** \( \Delta > 0, D_1 < 0, \) and \( F(P_1) = (P_1 - t_1)(P_1 - t_2)(P_1 - t_3). \) When \( t_1 < t_2 < t_3, \) if \( t_1 < P_1 < t_2, \) the solution is

\[ q = \left[ t_1 + (t_2 - t_1) \sin^2 \left( \frac{\sqrt{t_3 - t_1}}{2} \right) \left( -\frac{2A_3}{15k^2} \right)^{\frac{1}{2}} (\xi_1 - \xi_0), m \right] e^{i(-\kappa x + \omega t + \theta)}, \]
\[ (131) \]

and if \( P_1 > t_3, \) the solution is

\[ q = \left[ t_3 - t_2 \sin^2 \left( \frac{\sqrt{t_3 - t_2}}{2} \right) \left( -\frac{2A_3}{15k^2} \right)^{\frac{1}{2}} (\xi_1 - \xi_0), m \right] e^{i(-\kappa x + \omega t + \theta)}, \]
\[ (132) \]

where \( t_1, t_2, \) and \( t_3 \) are real numbers, and \( m^2 = \frac{\kappa - \eta}{\eta - \kappa}. \)

**Case 4.** \( \Delta < 0, \) and \( F(P_1) = (P_1 - t_1)(P_1^2 + IP_1 + j), t_1^2 - 4j < 0. \) The solution is

\[ q = \left[ t_1 - \sqrt{t_1^2 + l t_1 + j} + \frac{2 \sqrt{t_1^2 + l t_1 + j}}{1 + cn((t_1^2 + l t_1 + j)^{\frac{1}{2}} (\xi_1 - \xi_0), m)} \right] e^{i(-\kappa x + \omega t + \theta)}, \]
\[ (133) \]
where $t_1$, $l$, and $j$ are real numbers, and $m^2 = \frac{1}{2}(1 - \frac{q^2}{\sqrt{1 + b_1 t}})$.

3.5. Parabolic-Nonlocal Law

In this case, the model is

\[
\begin{align*}
\dot{q}t_1 + i a_1 r_{xxxx} + b_1 r_{xxxx} + (c_1 |q|^2 + d_1 |r|^2) x q + (\xi_1 |q|^4 + \eta_1 |q|^2 |r|^2 + \xi_2 |r|^4) q + i a_1 q_x + \beta_1 t_r &= 0, \\
\dot{r}t_1 + i a_2 q_{xxxx} + b_2 q_{xxxx} + (c_2 |r|^2 + d_2 |q|^2) x \tau q + (\xi_2 |r|^4 + \eta_2 |r|^2 |q|^2 + \xi_3 |q|^4) r + i a_2 r_x + \beta_2 q &= 0.
\end{align*}
\]

(134) \hspace{1cm} (135)

Inserting Equations (10) and (11) into Equations (134) and (135) provides us with the ancillary equations

\[
\begin{align*}
P_1(-k^3 a_1 + k^4 b_1 + \beta_1) + \eta_1 P_1^3 P_1^{2p} + \xi_2 P_1^{2p} + 2k^2 c_1 P_1^{2p} + 3k_k a_1 P_1^{2p} - 6k^2 k^2 b_1 P_1^{2p} \\
+ k^4 b_1 P_1^{(4)} + P_1(2k^2 d_1 P_1^{2p} + 2k^2 b_1 P_1^{2p} + \xi_1 P_1^{2p} + \alpha_1 k + 2k^2 c_1 P_1^{2p} - \omega) &= 0, \\
k^3 P_1^{2p}(a_1 - 4b_1 k) + k P_2(4b_1 k^3 P_2^{2p} - 3a_1 k^2) + k P_1^{(1)}(a_1 - \nu) &= 0,
\end{align*}
\]

(136) \hspace{1cm} (137)

Setting

\[P_2 = \chi P_1,\]

(138)

Equations (136) and (137) become

\[
\begin{align*}
P_1^3(\chi^4 \xi_1 + \chi^2 \eta_1 + \xi_1) + P_1(-a_1 \chi^3 + a_1 k + b_1 \chi^4 + \beta_1 \chi + 2c_1 k^2 P_1^{2p} + 2k^2 d_1 k^2 P_1^{2p} - \omega) \\
+ \chi^2 P_1^{(2p)}(3a_1 k - 6b_1 k^2) + b_1 \chi^4 P_1^{(2p)} + 2k^2 P_1^{2p} P_1^{(1)}(c_1 + \chi^2 d_1) &= 0,
\end{align*}
\]

(139)

and

\[k(a_1 \chi^2 k^2 P_1^{(2p)} - 3\chi^2 P_1^{(2p)} + 4b_1 k(\chi^2 P_1^{(2p)} - \chi^2 P_1^{(2p)} + P_1^{(1)}(a_1 - \nu)) = 0,\]

(140)

by virtue of the constraints

\[
\begin{align*}
\chi^4 \xi_1 + \chi^2 \eta_1 + \xi_1 &= \chi(\chi^4 \xi_2 + \chi^2 \eta_2 + \xi_2), \\
-a_1 \chi^3 + a_1 k + b_1 \chi^4 + \beta_1 \chi - \omega &= a_2 \chi^3 - a_2 k^3 + b_2 k^4 + \beta_2 - \chi \omega, \\
c_1 + \chi^2 d_1 &= \chi(c_2 \chi^2 + d_2), \\
\chi(3a_2 k - 6b_1 k^2) &= 3a_2 k - 6b_2 k^2, \\
b_1 \chi &= b_2.
\end{align*}
\]

Equation (140) gives way to the velocity

\[v = -3a_1 \chi k^2 + a_1 + 4b_1 \chi^3,\]

(142)

with the usage of the conditions

\[a_2 \chi - 3a_2 k^2 + 4b_2 k^3 = -3a_1 \chi^2 k^2 + a_1 \chi + 4b_1 \chi^2 k^3,\]

(143)

\[a_1 = 4b_1 k,\]

(144)

while Equation (139) becomes

\[A_2(P_1 P_1^{(2p)} + P_1^{2p} P_1^{(1)}) + A_1 P_1^{(1)} + A_4 P_1^{2p} + A_3 P_1 + k^2 P_1^{(2p)} = 0,\]

(145)

where

\[
\begin{align*}
A_1 &= \frac{3\chi k^2(a_1 - 2b_1 k)}{b_1 \chi k^2}, \\
A_2 &= \frac{2k^2(c_1 + \chi^2 d_1)}{b_1 \chi k^2}, \\
A_3 &= \frac{-a_1 \chi k^3 + a_1 k + b_1 \chi^4 + \beta_1 \chi - \omega}{b_1 \chi k^2}, \\
A_4 &= \frac{\chi^4 \xi_1 + \chi^2 \eta_1 + \xi_1}{b_1 \chi k^2}.
\end{align*}
\]

(146)
By virtue of the balance procedure in (145), Equation (5) becomes

\[(p_1')^2 = \frac{s_3}{2} p_1^4 + \frac{2s_2}{3} p_1^3 + s_1 p_1^2 + 2s_0 p_1 + s,\]  \hspace{1cm} (147)

where

\[s_3 = \frac{-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4}}}{24k^2},\]

\[s_2 = 0,\]

\[s_1 = \frac{-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4} A_1}}{2k^2(5(-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4} A_1} + 24A_2)),}\]

\[s_0 = 0,\]

\[s = (9(-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4} A_1} + 48(-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4} A_1} A_2}

\[- 100k^2(-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4} A_1} A_3 - 960k^2(-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4} A_1} A_2 A_3 - 2304k^2 A_2^2 A_3)) / (k^2((-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4}} + 4A_2)) (5(-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4} + 24A_2})^2).\]  \hspace{1cm} (148)

With the usage of the relations

\[U = (2s_3)^{\frac{1}{4}} p_1^2, \xi_1 = (2s_3)^{\frac{1}{4}} \xi,\]  \hspace{1cm} (149)

Equation (147) simplifies to

\[(U_{\xi_1})^2 = U^3 + \zeta_2 U_2 + \zeta_1 U,\]  \hspace{1cm} (150)

where

\[\zeta_2 = \frac{-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4}}}{12k^2},\]

\[\zeta_1 = \frac{36(-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4} A_1} A_3 + 192(-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4} A_1} A_2 A_3 - 400k^2(-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4} A_1} A_2 A_3 - 9216k^2 A_2 A_3)) / (k^2((-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4}} + 4A_2)) (5(-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4} + 24A_2})^2)^2.\]  \hspace{1cm} (151)

We rewrite Equation (150) as

\[\pm (\xi_1 - \xi_0) = \int \frac{dU}{\sqrt{F(U)}},\]  \hspace{1cm} (152)

where

\[F(U) = U(U^2 + \zeta_2 U + \zeta_1).\]  \hspace{1cm} (153)

We consider the discriminant system

\[\Delta = \zeta_2^2 - 4\zeta_1.\]  \hspace{1cm} (154)

**Case 1.** \(\Delta = 0.\) For \(U > 0,\) if \(\zeta_2 < 0,\) we have the dark and singular solitons

\[q = \left((-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4}} \right)^{\frac{1}{4}} (-\frac{\zeta_2}{2} \tanh(\frac{1}{2} \sqrt{\frac{\zeta_2}{2}}((-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4}} \right)^{\frac{1}{4}} \xi - \xi_0)))) \frac{1}{2} e^{(-\xi + \omega t + \theta)},\]  \hspace{1cm} (155)

\[q = \left((-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4}} \right)^{\frac{1}{4}} (-\frac{\zeta_2}{2} \coth(\frac{1}{2} \sqrt{\frac{\zeta_2}{2}}((-3A_2 \pm \sqrt{3\sqrt{3A_2^2 - 32k^2 A_4}} \right)^{\frac{1}{4}} \xi - \xi_0)))) \frac{1}{2} e^{(-\xi + \omega t + \theta)}.\]  \hspace{1cm} (156)
if $\zeta_2 > 0$, we have the singular periodic solution

$$q = \left\{(\frac{-3A_2 \pm \sqrt{3\sqrt{\frac{3A_2^3}{32k^2A_4}}}}{12k^2})^{-\frac{1}{2}} \left(\frac{\zeta_2}{2} \tan^2 \left(\frac{1}{2} \sqrt{\frac{\zeta_2}{2}} \left(\frac{-3A_2 \pm \sqrt{3\sqrt{\frac{3A_2^3}{32k^2A_4}}}}{12k^2}\right)^{\frac{3}{2}} \xi \right) - \xi_0\right)\right\}^{\frac{1}{2}} e^{(-\kappa x + \omega t + \theta)}, \quad (157)$$

if $\zeta_2 = 0$, we have

$$q = \left\{(\frac{-3A_2 \pm \sqrt{3\sqrt{\frac{3A_2^3}{32k^2A_4}}}}{12k^2})^{-\frac{1}{2}} \left(\frac{\zeta_2}{2} \coth^2 \left(\frac{1}{2} \sqrt{\frac{\zeta_2}{2}} \left(\frac{-3A_2 \pm \sqrt{3\sqrt{\frac{3A_2^3}{32k^2A_4}}}}{12k^2}\right)^{\frac{3}{2}} \xi \right) - \xi_0\right)\right\}^{\frac{1}{2}} e^{(-\kappa x + \omega t + \theta)}, \quad (158)$$

Case 2. $\Delta > 0$, and $\zeta_1 = 0$. For $U > -\zeta_2$, if $\zeta_2 > 0$, we have the dark and singular solitons

$$q = \left\{(\frac{-3A_2 \pm \sqrt{3\sqrt{\frac{3A_2^3}{32k^2A_4}}}}{12k^2})^{-\frac{1}{2}} \left(\frac{\zeta_2}{2} \tan^2 \left(\frac{1}{2} \sqrt{\frac{\zeta_2}{2}} \left(\frac{-3A_2 \pm \sqrt{3\sqrt{\frac{3A_2^3}{32k^2A_4}}}}{12k^2}\right)^{\frac{3}{2}} \xi \right) - \xi_0\right)\right\}^{\frac{1}{2}} e^{(-\kappa x + \omega t + \theta)}, \quad (159)$$

$$q = \left\{(\frac{-3A_2 \pm \sqrt{3\sqrt{\frac{3A_2^3}{32k^2A_4}}}}{12k^2})^{-\frac{1}{2}} \left(\frac{\zeta_2}{2} \coth^2 \left(\frac{1}{2} \sqrt{\frac{\zeta_2}{2}} \left(\frac{-3A_2 \pm \sqrt{3\sqrt{\frac{3A_2^3}{32k^2A_4}}}}{12k^2}\right)^{\frac{3}{2}} \xi \right) - \xi_0\right)\right\}^{\frac{1}{2}} e^{(-\kappa x + \omega t + \theta)}, \quad (160)$$

if $\zeta_2 < 0$, we have the singular periodic solution

$$q = \left\{(\frac{-3A_2 \pm \sqrt{3\sqrt{\frac{3A_2^3}{32k^2A_4}}}}{12k^2})^{-\frac{1}{2}} \left(\frac{\zeta_2}{2} \tan^2 \left(\frac{1}{2} \sqrt{\frac{\zeta_2}{2}} \left(\frac{-3A_2 \pm \sqrt{3\sqrt{\frac{3A_2^3}{32k^2A_4}}}}{12k^2}\right)^{\frac{3}{2}} \xi \right) - \xi_0\right)\right\}^{\frac{1}{2}} e^{(-\kappa x + \omega t + \theta)}, \quad (161)$$

Case 3. $\Delta > 0$, and $\zeta_1 \neq 0$. Suppose that $\gamma_1 < \gamma_2 < \gamma_3$, one of them is zero, and the other two are roots of $U^2 + \zeta_2 U + \zeta_1$. For $\gamma_1 < U < \gamma_2$, we have

$$q = \left\{(\frac{-3A_2 \pm \sqrt{3\sqrt{\frac{3A_2^3}{32k^2A_4}}}}{12k^2})^{-\frac{1}{2}} \left[\gamma_3 - \gamma_2 \tan^2 \left(\frac{\sqrt{\gamma_3 - \gamma_2}}{2} \left(\frac{-3A_2 \pm \sqrt{3\sqrt{\frac{3A_2^3}{32k^2A_4}}}}{12k^2}\right)^{\frac{3}{2}} \xi \right) - \xi_0\right]\right\}^{\frac{1}{2}} e^{(-\kappa x + \omega t + \theta)}, \quad (162)$$

and for $U > \gamma_3$, we have

$$q = \left\{(\frac{-3A_2 \pm \sqrt{3\sqrt{\frac{3A_2^3}{32k^2A_4}}}}{12k^2})^{-\frac{1}{2}} \left[\gamma_3 - \gamma_2 \tan^2 \left(\frac{\sqrt{\gamma_3 - \gamma_2}}{2} \left(\frac{-3A_2 \pm \sqrt{3\sqrt{\frac{3A_2^3}{32k^2A_4}}}}{12k^2}\right)^{\frac{3}{2}} \xi \right) - \xi_0\right]\right\}^{\frac{1}{2}} e^{(-\kappa x + \omega t + \theta)}, \quad (163)$$

where $m^2 = \frac{\gamma_2 - \gamma_1}{\gamma_3 - \gamma_1}$.

Case 4. $\Delta < 0$, for $U > 0$, we have

$$q = \left\{(\frac{-3A_2 \pm \sqrt{3\sqrt{\frac{3A_2^3}{32k^2A_4}}}}{12k^2})^{-\frac{1}{2}} \left(\frac{2\sqrt{\gamma_1} \left(\frac{-3A_2 \pm \sqrt{3\sqrt{\frac{3A_2^3}{32k^2A_4}}}}{12k^2}\right)^{\frac{3}{2}} \xi \right)}{1 + \sqrt{\zeta_1}}\right\}^{\frac{1}{2}} e^{(-\kappa x + \omega t + \theta)}, \quad (164)$$

where $m^2 = 1 - \frac{\zeta_2}{\zeta_1}$. We have obtained the exact solutions $q(x, t)$ in this section, so according to the relation $r = \chi q$, the solutions $r(x, t)$ can be obtained. We omit them.

4. Conclusions

The current paper retrieved CQ dark and singular soliton solutions in fiber Bragg gratings. Such solitons are a new kind of soliton, known as the Bragg soliton or the gap soliton, which can form in nonlinear media whose refractive index varies weakly in a periodic fashion along its length [29,30]. The study was conducted with five forms of self-phase modulation. The results are very useful when dark soliton dynamics are to be handled in detail. The integration scheme that yielded such dark and singular solitons was the trial equation approach. Visibly, this approach had a shortcoming. This approach
Axioms 2022, 11, 640
failed to reveal the much-needed bright soliton solutions that are needed in fiber optic communication dynamics.

In future work, the model will be addressed from a numerical perspective with the usage of the Adomian Decomposition approach, the Laplace–Adomian decomposition method, the finite element method, the finite difference method, and other relevant approaches.

Apart from the regime of a deterministic system, it is also very important to explore the world of stochasticity where the random noise could be a detrimental factor. In this case, later, the model will be revisited with an additive stochastic perturbation term. This would be Gaussian noise; therefore, the corresponding dynamical system of the soliton parameters will be formulated in presence of noise. The corresponding Langevin equation will subsequently be revealed. Upon solving this Langevin equation, the mean free velocity will be computed. The results should align with the previously published results [31].

Multiplicative white noise will also be considered later as a derivative of the Weiner process. This will lead to the analysis of the model with the aid of Ito Calculus, which will lead to the stochastic effect only in the phase components of the solitons. The remaining physical factors of the solitons will remain unaffected. The results should align along the lines of the previously reported results [32].
