## **Supplementary Material**

Supplementary Figure 1: Cx43 expression and gap junction intercellular communication in stably transfected cells. (A) Cx43 expression was determined by qRT-PCR in B16F10 melanoma cells stably transfected with plasmids expressing short hairpin RNAs against Cx43 (shCx43) or control shRNAs (shCtrl) and cultured in hypoxia (1%  $O_2$ ) for 24 hours. Cx43 expression levels were obtained by the  $\Delta/\Delta$ Ct method and normalized to actin expression. (B) Hypoxic (24 hours 1%  $O_2$ ) B16F10 cells expressing wild type or a dominant negative Cx43 mutant (Cx43<sup>WT</sup>, Cx43<sup>DN</sup>, respectively), were pre-loaded with calcein-AM and co-cultured for 1 hour with Violet BMQC-pre-loaded pMEL-1 cytotoxic T lymphocytes (CTLs), at a 1:5 ratio. Calcein transfer from melanoma to CTLs was assessed by flow cytometry. The bar graph shows calcein transfer (Violet BMQC<sup>+</sup>calcein<sup>+</sup> cells) as percentage of the maximum.

Supplementary Figure 2: Human monocyte-derived dendritic cells acquire miR210-3p and miR449a from hypoxic Mel3 melanoma cells. (A) Experimental scheme. Mel3 melanoma cells were cultured for 72 hours upon normoxic (21%  $O_2$ , N) or hypoxic (1%  $O_2$ , H) conditions. Then, N and H melanoma cells were co-cultured for 2 hours with monocyte-derived dendritic cells (mo-DC) upon a 1:2 cell ratio. After co-culture, mo-DC and melanoma cells were isolated using CD11c<sup>+</sup> magnetic cell sorting. Total RNA samples (including the miRNAs) were isolated from pre-co-culture (named culture, orange lines) and post-co-culture (named co-culture, blue dashed lines) cells and miRNA expression analysed by qRT-PCR. (B) The expression levels of miR-210-3p, -449a (left), -135a-5p, -504-5p (middle), -192-5p, and -148a-3p (right), were evaluated by qRT-PCR assays in the cells obtained as described in (A). The levels of miRNA expression were obtained by the  $\Delta/\Delta$ Ct method and normalized to small nuclear RNA RNU6-2. \*\* *p* < 0.01; ns: non-significant (two-tailed Student's *t*-test).

**Supplementary Figure 3: Correlations of ZEB2 and granzymes mRNA expression in cancer patients.** Correlations of GZMA, GZMB and ZEB2 expression levels in The Cancer Genome Atlas (TCGA) database estimated by TIMER2.0 resource (<u>http://timer.cistrome.org/</u>) in breast invasive carcinoma (BRCA; n = 1100 patients), lung adenocarcinoma (LUAD; n = 515 patients), and uterine corpus endometrial carcinoma (UCEC; n = 545 patients). Spearman's rho and *p* values are shown.

**Supplementary Figure 4: Main antitumor roles of Cx43-GJICs in the cancer-immunity cycle.** 1. Cx43 expression in melanoma cells allows the transfer of pre-processed tumor associated antigens (TAAs) from melanoma cells to dendritic cells (DCs), improving DC-based tumor vaccination by increasing CD8<sup>+</sup> T cell activation and antitumor immunity [1]. Cancer cells produce cGAMP that is transferred via Cx43-GJs to

tumor-associated DCs and macrophages, which respond by producing type I IFN *in situ*, thus, increasing tumor immunogenicity [2]. 2. Cx43-GJs participate in melanoma antigen transfer and cross-presentation between human DCs, facilitating a more effective DC-mediated T cell activation [3]. 3. Cx43-GJs accumulate at the immunological synapse formed between DCs and melanoma-specific CD4<sup>+</sup> T cells, CD8<sup>+</sup> T cells and natural killer (NK) cells, contributing to lymphocyte activation [4-6]. 4. Cx43-GJs accumulate at the cytotoxic immunological synapses formed between NK cells or CD8<sup>+</sup> cytotoxic T lymphocytes (CTL) and melanoma cells, contributing to granzyme b-mediated induction of apoptosis in the target cells [5-8]. 5. The hypoxic tumor microenvironment decreases the susceptibility of melanoma cells to cytotoxic NK cell-mediated elimination via the autophagy mediated degradation of Cx43-GJ [7], and as suggested by our results, by transferring hypoxia-induced miRNAs to CTLs and repressing their cytotoxic activity. DAMPs: danger associated molecular patterns; ICD: immunogenic cell death; TdLN: tumor-draining lymph node.

**Supplementary Figure 5: Proposed model for Cx43-dependent suppression of cytotoxic activity of cytotoxic T lymphocytes by hypoxic melanoma cells.** We identified that Cx43 and miR-192-5p expressions were strongly induced in hypoxic melanoma cells. This miRNA was acquired by cytotoxic T lymphocytes (CTLs) after co-culture with hypoxic melanoma cells by a cell-contact-dependent and Cx43-mediated mechanism. Associated with the acquisition of miR-192-5p, the levels of Zeb2 (a strongly validated target of miR-192-5p) decreased in CTL after co-culture with hypoxic melanoma cells. The diminished Zeb2 expression could explain the lower cytotoxic activity of the CTLs.

Supplementary Figure 6: Cytotoxic T lymphocytes acquire miR210-3p from hypoxic B16F10 cells. (A) B16F10 melanoma cells were cultured for 24 hours upon normoxic (21%  $O_2$ , N) or hypoxic (1%  $O_2$ , H) conditions. Then, N and H melanoma cells were co-cultured for 2 hours with pMEL-1 cytotoxic T lymphocytes (CTL) upon a 1:2 cell ratio. After co-culture, CTLs and melanoma cells were isolated by CD8<sup>+</sup> magnetic cell sorting. Total RNA samples (including the miRNAs) were isolated from pre-co-culture (named culture, orange lines) and post-co-culture (named co-culture, blue dashed lines) cells, and miR-210-3p (A), miR210 precursor (B), gp100 or CD8 mRNA (C, left and right, respectively) expression levels were analysed by qRT-PCR. Expression levels were obtained by the  $\Delta/\Delta$ Ct method and normalized to small nuclear RNA RNU6-2 (mature and precursor miRNAs) or actin (mRNAs). \* *p* < 0.05; ns: non-significant (two-tailed Student's *t*-test).
