Figure S1. Representative TEM images of BSA-stabilized Mitsui-7 in H₂O. The scale bar for panel **a-g**, 500 nm, **h-n**, 1 μm and **o-r**, 2 μm. The CNT dispersion contains both single CNTs and small bundles.

Figure S2. Representative TEM images of BSA-stabilized Nanocyl in H₂O. The scale bar for panel **a-c**, 100 nm and **d-i**, 200 nm.

Figure S3. Representative TEM images of Mitsui-7 in CCM. Scale bar for panel **a-c**. 500 nm, **d-h**. 1 μm and **i**. 2 μm . Round particles observed are salts which are present in CCM.

Figure S4. Representative TEM images of Nanocyl in CCM. Scale bar for panel **a-e**. 100 nm, and **f-1**. 200 nm.

Figure S5. Enhanced darkfield-fluorescence image of A549 human lung epithelial cells cultured in CCM. The F-actin cytoskeleton (magenta) and cell nuclei (cyan) were stained with Rhodamine Phalloidin and DAPI respectively.

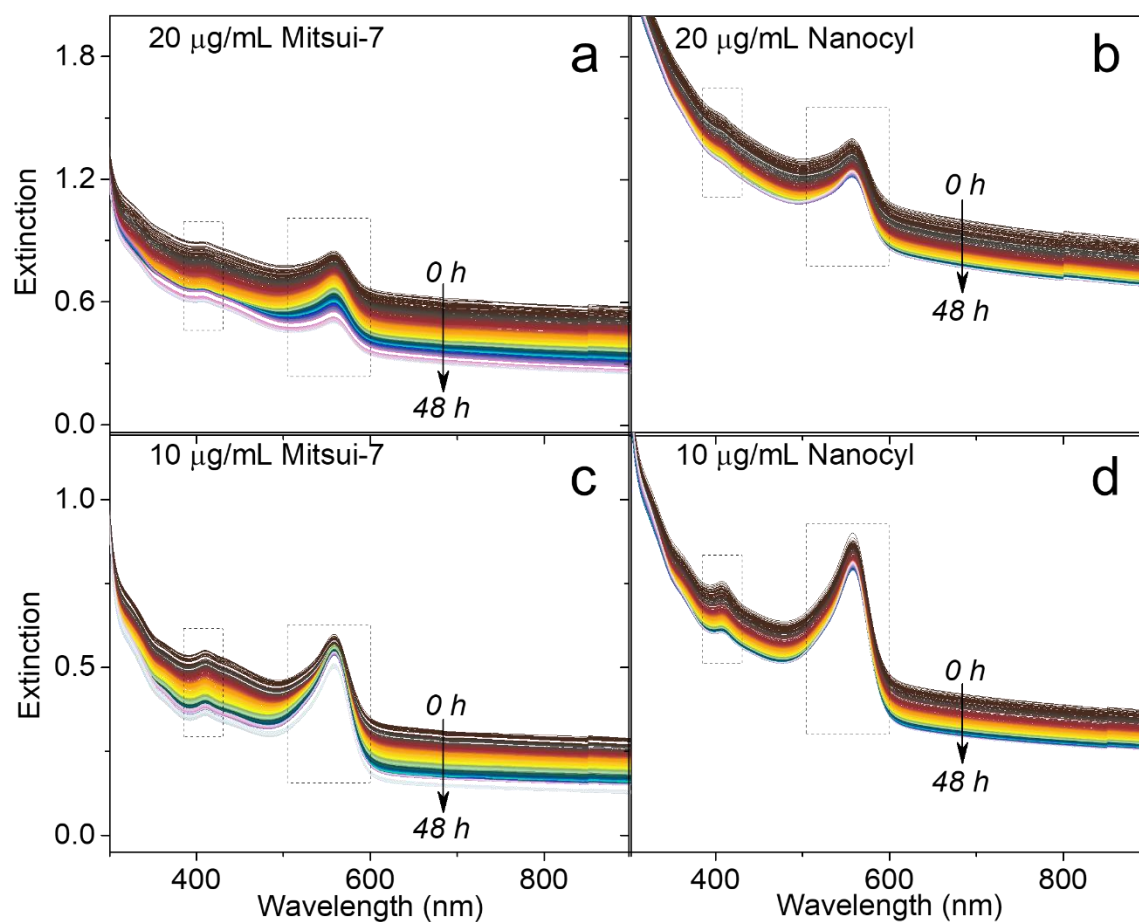

Figure S6. Spectral evolution of the optical extinction of Mitsui-7 and Nanocyl. Mitsui-7 and Nanocyl are dispersed in CCM at initial concentration of 20 $\mu\text{g/mL}$ (panel a and b) and 10 $\mu\text{g/mL}$ (panel c and d) over 48 h at 37 $^{\circ}\text{C}$. In all the cases, a decay of optical extinction (black arrow) is observed over time. The bands framed in dashed rectangles show clearly the matrix interferences from proteins ($\lambda = 413 \text{ nm}$) and phenol red ($\lambda = 558 \text{ nm}$).

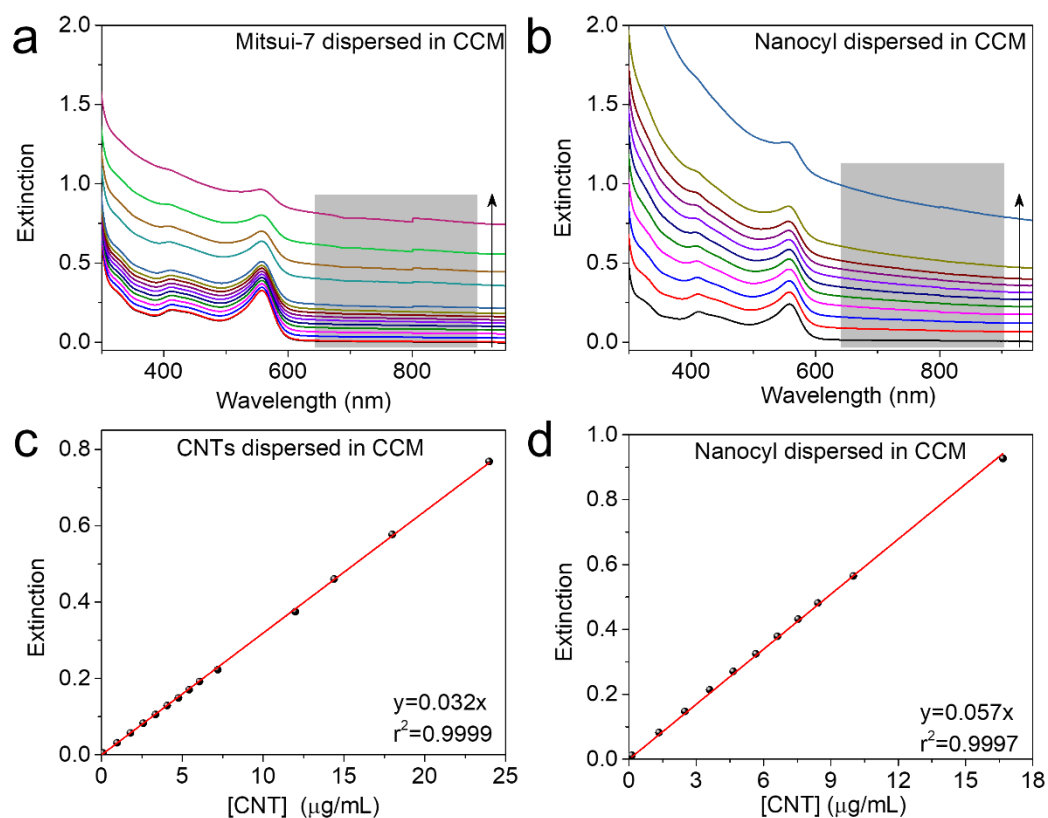

Figure S7. UV-VIS analysis of Mitsui-7 and Nanocyl. **a.** Mitsui-7 and **b.** Nanocyl are dispersed in CCM at different concentrations. Experimentally determined standard curves of **c.** Mitsui-7 and **d.** Nanocyl dispersions in CCM. Extinction values for a seventeen-point of Mitsui-7 samples and eleven-point of Nanocyl dilution series were measured using an UV-Vis-NIR spectrophotometer and integrated from 640 to 900 nm (indicated by grey square). A linear relationship (red line panel c and d) between the concentration of CNTs and the extinction was found at the range studied here.

Table S1. Estimated values of CNT deposited doses at 4, 24 and 48 h.

<i>Dose₀</i> [$\mu\text{g}/\text{cm}^2$]	<i>Time point [h]</i>	CCM	
		<i>Estimated Dose_D</i> [$\mu\text{g}/\text{cm}^2$] ^a (Delivery fraction %)	CV [%] ^b
Mitsui-7			
3.9	4	0.63 \pm 0.22 (16 \pm 4)	34
3.9	24	1.92 \pm 0.36 (49 \pm 7)	18
3.9	48	2.60 \pm 0.51 (66 \pm 11)	19
7.9	4	1.34 \pm 0.33 (17 \pm 3)	24
7.9	24	3.69 \pm 0.42 (47 \pm 4)	11
7.9	48	4.98 \pm 0.76 (63 \pm 8)	15
Nanocyl			
3.9	4	0.38 \pm 0.01 (10 \pm 1)	3
3.9	24	0.86 \pm 0.08 (22 \pm 2)	9
3.9	48	0.98 \pm 0.09 (25 \pm 2)	9
7.9	4	0.58 \pm 0.30 (7 \pm 4)	52
7.9	24	1.19 \pm 0.46 (15 \pm 6)	39
7.9	48	1.28 \pm 0.34 (16 \pm 4)	27

^a Number of independent samples per dose and time point = 3 (mean \pm SD). The dose corresponds to area of measurement of 3.8 cm².

^b CV is defined as the SD divided by the mean, with the result reported as a percentage.
