

Interviews

Jean-Marie Annoni, Claudio Bassetti

This edition of the SANP presents different topics related to neurology. We were glad to find a didactic contribution on an important neurosurgical problem, namely thoracic hernias. It is important for our journal to have input from all disciplines of clinical neurosciences, particularly for problems that are potentially sources of chronic morbidity.

We want also to propose an innovative section. As you know, the aim of our journal is to inform clinicians and members of the neurosciences community not only on specific studies, but also about progress, the state of the art, research, thinking and history of neurology and psychiatry.

In order to better cover various aspects of the future of our professions we propose to interview different players in the Swiss neurosciences community. In this interview

section we will present opinions or views of clinicians, scientists and other persons involved in brain health. This section is meant to be interactive, will be in written form or oral (Podcast), and in certain situations will be associated with a blog in order to promote interaction and progress in our global thinking.

The aim of this section is to propose opinions, that do not necessarily reflect the opinion of the journal, but which are worth presenting and taking into consideration in the Swiss neuropsychiatric world. The first interview is with Professor Richard Frackowiak, who played an important role in the preparation and the defense of the Human brain project.

You will find this interview in the website of SANP www.sanp.ch/interviews
