Abstract: Willmore defined embedded surfaces on $f : S \to E^3$, which is the embedding of $S$ into Euclidean 3-space. He investigated the Euclidean metric of $E^3$, inducing a Riemannian structure on $f(S)$. The expression analogous to the left-hand member of the curvature $K$ is replaced by the mean curvature $H^2$ on $f(S)$. Our aim is to observe the Gaussian and mean curvatures of curve–surface pairs using embedded surfaces in different curve–surface pairs and to define some developable operations on their curve–surface pairs. We also investigate the embedded surfaces using the Willmore method. We first recall the Darboux curve–surface and derive the new characterizations. This curve–surface pair is called the osculating Darboux curve–surface if its position vector always lies in the osculating Darboux plane spanned by a Darboux frame. Thus, we observed an osculating Darboux curve–surface pair. We also obtained the $\sim D$-scroll of the curve–surface pair and involute $\sim D$-scroll of the curve–surface pair with some differential geometric elements and found $\sim D_{(a,M)}(s)$ and $\sim D_{(a,M)}^*(s)$-scrolls of the curve–surface pair $(a,M)$.

Keywords: curve–surface pair; embedded; curvatures; Gaussian curvature; mean curvature; osculating Darboux frame

MSC: 53A04; 53A05

1. Introduction

Curves, surfaces, and curve–surface pairs are essential structures in differential geometry. Willmore defined embedded surfaces on $f : S \to E^3$ as embedding of $S$ into Euclidean 3-space. He took the Euclidean metric of $E^3$ and induced it to a Riemannian structure on $f(S)$. The expression analogous to the left-hand member of the curvature $K$ is replaced by the mean curvature $H^2$ on $f(S)$. Our aim is to observe the Gaussian and mean curvatures of curve–surface pairs using embedded surfaces in different curve–surface pairs and to define some developable operations on their curve–surface pairs. We also investigate the embedded surfaces using the Willmore method. We first recall the Darboux curve–surface and derive the new characterizations. This curve–surface pair is called the osculating Darboux curve–surface if its position vector always lies in the osculating Darboux plane spanned by a Darboux frame. Thus, we observed an osculating Darboux curve–surface pair. We also obtained the $\sim D$-scroll of the curve–surface pair and involute $\sim D$-scroll of the curve–surface pair with some differential geometric elements and found $\sim D_{(a,M)}(s)$ and $\sim D_{(a,M)}^*(s)$-scrolls of the curve–surface pair $(a,M)$.
A regular curve is defined by curvatures $\kappa$ and $\tau$ and a curve–surface pair is defined by curvatures $k_n$, $k_g$ and $t_r$. A regular curve is called a general helix if its first and second curvatures $\kappa$ and $\tau$ are not constant, but $\frac{\tau}{\kappa}$ is constant.

Many papers have considered the involute–evolute curves. For example [21–23]. Using a similar method, we produce a new ruled surface based on another ruled surface. In [21], $\sim D$-scroll, which is known as the rectifying developable surface, of any curve $\alpha$ and the involute $\sim D$-scroll of the curve $\alpha$ are already defined as $E^3$. In [21–23], special ruled surfaces of $\sim D$-scroll and involute $\sim D$-scroll are considered, which are associated with a space curve $\alpha$ with a curvature $\kappa \neq 0$ and involute $\beta$.

The objective of this study is to analyze the Gaussian and mean curvatures of curve–surface pairs utilizing embedded surfaces across various curve–surface pair configurations. Additionally, we aim to perform developable operations on these curve–surface pairs, thoroughly investigating their properties. We employ the Gauss–Bonnet theorem by Willmore to characterize developable curve–surface pairs, particularly focusing on those whose position vectors align with the planes spanned by the osculating Darboux frame, as discussed in [1]. Also, we obtain the $\sim D$-scroll within a specific type of strip and the involute $\sim D$-scroll within another type of strip, incorporating various differential geometric components such as the Weingarten map $S$, mean, and Gaussian curvatures. Notably, we explore the curvatures of the $a, b, c$ invariants, denoted as $k_a = -b, k_g = c, t_r = a$ (Curvatures of a Strip) and determine $\sim D(a, M)(s)$ and $\sim D^*(a, M)(s)$ - scrolls of the strip $(a, M)$ along with the modified Darboux vector field of the involute $(\beta, M)$, following methodologies outlined in previous works [1,7,16,21–23].

Then, we review some basic concepts regarding curve–surface pairs, embedded surfaces, osculating Darboux frame, and $\sim D$-scroll with some differential geometric elements.

2. Preliminaries

**Definition 1.** Let $\alpha : I \rightarrow R^3$ be a curve $\alpha(s) \neq 0$ where $T(s) = \alpha'(s)$ is a unit tangent vector of $\alpha$ at $s$ and $M$ is a surface in Euclidean 3-space. We define a surface element of $M$ as the part of a tangent plane at the neighbour of the point. The locus of the these surface elements along the curve is called a curve–surface pair, shown as $(\alpha, M)$, [24].

**Definition 2.** Let $\vec{t}$ be the tangent vector field of curve $\alpha$, $\vec{n}$ be the normal vector field of the curve $\alpha$, and $\vec{b}$ be the binormal vector field of curve $\alpha$ [17]. Frenet vectors of the curve are shown as $\{\vec{V}_1, \vec{V}_2, \vec{V}_3\}$. Here, $\vec{v}_1 = \vec{t}$, $\vec{v}_2 = \vec{n}$, $\vec{v}_3 = \vec{b}$. The strip vector fields of a strip that belong to curve $\alpha$ are $\{\vec{\xi}, \vec{\eta}, \vec{\zeta}\}$. These vector fields are:

- Strip tangent vector field is $\vec{t} = \vec{\zeta}$
- Strip normal vector field is $\vec{n} = \vec{\eta}$
- Strip binormal vector field is $\vec{b} = \vec{\xi}$ ([17]).

We can write

\[
\begin{align*}
\vec{t} &= \vec{\zeta} \\
\vec{n} &= \cos \varphi \, \vec{\eta} + \sin \varphi \, \vec{\zeta} \\
\vec{b} &= -\sin \varphi \, \vec{\eta} + \cos \varphi \, \vec{\zeta}.
\end{align*}
\]

Let $\{\vec{t}, \vec{n}, \vec{b}\}$ and $\{\vec{\xi}, \vec{\eta}, \vec{\zeta}\}$ be the curve and the curve–surface pair’s vector fields. The curve–surface pair tangent vector field, normal vector field, and binormal vector field are provided by $\vec{t} = \vec{\zeta}, \vec{\zeta} = \vec{N}$ and $\vec{\eta} = \vec{\xi} \wedge \vec{\zeta}$. Curve $\alpha$ has two curvatures, $\kappa$ and $\tau$. A
curve has a curve–surface pair with three curvatures \( k_\nu = -b, k_\zeta = c, t_\tau = a \), which are the normal curvature, geodesic curvature, and geodesic torsion of the curve–surface pair. If \( \{ \vec{\xi}, \vec{\eta}, \vec{\zeta} \} \) is the curve–surface pair’s vector fields on \( \alpha \), we have derivatives of the \( \vec{\xi}, \vec{\eta}, \vec{\zeta} \),

\[
\vec{\xi}' = c \vec{\eta} - b \vec{\zeta} \\
\vec{\eta}' = -c \vec{\xi} + a \vec{\zeta} \\
\vec{\zeta}' = b \vec{\xi} - a \vec{\eta}
\]

Let \( \phi \) be the angle between \( \vec{b} \) and \( \vec{\zeta} \). From the last equation we have \( \vec{\zeta} = c \vec{\eta} - b \vec{\zeta} \). If we substitute \( \vec{\zeta} = \vec{t} \) in last equation, we obtain

\[
\vec{\zeta}' = \kappa n
\]

and

\[
b = -\kappa \sin \phi, \\
c = \kappa \cos \phi
\]

From the last two equations, we obtain,

\[
\kappa^2 = b^2 + c^2
\]

which denotes the relationship between the curvature \( \kappa \) of a curve \( \alpha \) and the normal curvature and the geodesic curvature of a curve–surface pair [17].

By using similar operations, we obtain a new equation, as follows

\[
\tau = a + \frac{bc - b'c}{b^2 + c^2}
\]

which shows the relationship between \( \tau \) (torsion or second curvature of \( \alpha \)) and \( a, b, c \) curvatures of a curve–surface pair that belongs to the curve \( \alpha \). From [17] we can also write

\[
a = \phi' + \tau.
\]

**Definition 3.** Let \( \alpha \) be a curve in \( M \subset E^3 \). If the geodesic curvature (torsion) of curve \( \alpha \) is equal to zero, then the curve–surface pair \( (\alpha, M) \) is called a curvature curve–surface pair. In Figure 1, we see the relations between Frenet vector fields of curve \( \alpha \) and the vector fields of \( (\alpha, M) \) [17].

![Figure 1](image)

If we take \( \phi \) as the angle between \( \vec{b} \) and \( \vec{\zeta} \), we can see in Figure 2.
Definition 4. Let $\alpha$ be a curve in $M \subset \mathbb{E}^3$. If the geodesic curvature (torsion) of the curve $\alpha$ is equal to zero, then the curve–surface pair $(\alpha, M)$ is called a curvature curve–surface pair [17].

Modified Darboux Vector Field of the Curve-Surface Pair $(\alpha, M)$ and $(\beta, M)$

In this section, we provide some preliminaries of the $\sim D$-scroll with some differential geometric elements.

Definition 5. Let the Frenet vector fields be $-\vec{V}_1(s) = -\vec{t}, -\vec{V}_2(s) = -\vec{n}, -\vec{V}_3(s) = -\vec{b}$ of $\alpha$ and let the first and second curvatures of the curve $\alpha(s)$ be $\kappa(s)$ and $\tau(s)$, respectively. The quantities $-\vec{t}, -\vec{n}, -\vec{b}, \kappa, \tau$ are collectively the Frenet–Serret apparatus of the curves. Also, $\{-\vec{\xi}, -\vec{\eta}, -\vec{\zeta}\}$ of the unit strip vector fields of $(\alpha, M)$ and $k_n = -b, k_\xi = c, t_r = a$ are the curvatures of strip $(\alpha, M)$. For any unit speed curve $\alpha$, in terms of the Frenet–Serret apparatus, the Darboux vector $D_{(\alpha, M)}$ can be expressed as

$$D_{(\alpha, M)} = -a + \frac{b c - b'}{b^2 + c^2} \xi + \sqrt{b^2 + c^2} \eta.$$

Definition 6. Let a vector field be $\tilde{D} = \frac{\tau}{\kappa}(s) V_1(s) + V_3(s)$ along $\alpha(s)$, under the condition that $\kappa = 0$ and it is called the modified Darboux vector field of $\alpha$ [21–23].

By using this definition, we can write

$$\tilde{D}_{(\alpha, M)} = \frac{-a + \frac{b c - b'}{b^2 + c^2}}{\sqrt{b^2 + c^2}} \xi + \sqrt{b^2 + c^2} \eta,$$

along $\alpha(s)$, under the condition that $\kappa = 0$ and it is called the modified Darboux vector field of the strip $(\alpha, M)$.

Definition 7. Let $S$ be a closed orientable surface, differentiable of class $C^\infty$, $f : S \to \mathbb{E}^3$ be a $C^\infty$ embedding on $S$ into $\mathbb{E}^3$ [1]. The Euclidean metric of $\mathbb{E}^3$ induces a Riemannian structure on $f(S)$. Let $\kappa$ and $\tau$ denote the principal curvatures of $f$, $H = (\kappa + \tau)/2$, and $K = \kappa \tau$ denote the mean and Gauss curvatures of $f$ at $P \in f(S)$, respectively. $f(S)$ is considered a hypersurface of $\mathbb{E}^3$. We define...
the mean and Gauss curvatures formulae in different curve–surface pair curvatures in [6,7]. We use the Gauss–Bonnet theorem for different curvatures of the curve–surface pairs such that

\[ \frac{1}{2\pi} \int \left( \sqrt{b^2 + c^2} \right) \left( a + \frac{bc - b'c'}{b^2 + c^2} \right) dS = \chi(S) \]  

(1)

where the right-hand member of (1) is the Euler characteristic of S.

In particular, we define \( \tau(f) \) by

\[ \tau(f) = \frac{1}{8\pi} \int \left[ \left( \sqrt{b^2 + c^2} \right)^2 + \left( a + \frac{bc - b'c'}{b^2 + c^2} \right)^2 \right] dS . \]  

(2)

We cannot expect \( \tau(f) \) to be a topological invariant of S; thus, we define \( \tau(f) \) by

\[ \tau(f) = \inf_{f \in F} \tau(f) \]  

(3)

where the infimum is taken over the space \( F \) of all \( C^\infty \)-embeddings of S in \( E^3 \) [1].

3. Curve–Surface Pairs on Embedded Surfaces

**Theorem 1.** Let S have a genus of 0. We have \( \tau(f) = 2 \) only if \( f(S) \) is an Euclidean sphere and is invariant for the curvatures of the curve–surface pair.

**Proof.** Let \( \kappa \) and \( \tau \) denote the principal curvatures of \( f \), \( H = (\kappa + \tau)/2 \) and \( K = \kappa \tau \) denote the mean and Gauss curvatures of \( f \) at \( P \in f(S) \). So, we have

\[ H^2 - K = \frac{1}{4} \left[ \left( \sqrt{b^2 + c^2} \right)^2 - \left( a + \frac{bc - b'c'}{b^2 + c^2} \right)^2 \right] \]

\[ 8\pi \frac{d\tau(f)}{dS} - 2\pi \frac{d\chi(S)}{dS} = \frac{1}{4} \left[ \left( \sqrt{b^2 + c^2} \right)^2 - \left( a + \frac{bc - b'c'}{b^2 + c^2} \right)^2 \right] \]

\[ 2\pi \frac{d[\tau(f) - \chi(S)]}{dS} = \frac{1}{4} \left[ \left( \sqrt{b^2 + c^2} \right)^2 - \left( a + \frac{bc - b'c'}{b^2 + c^2} \right)^2 \right] \]

\[ \frac{d}{dS} [\tau(f) - \chi(S)] = \frac{1}{8\pi} \left[ \left( \sqrt{b^2 + c^2} \right)^2 - \left( a + \frac{bc - b'c'}{b^2 + c^2} \right)^2 \right] \]

Thus, we have

\[ \tau(f) = \chi(S) + \frac{1}{8\pi} \int \left[ \left( \sqrt{b^2 + c^2} \right)^2 - \left( a + \frac{bc - b'c'}{b^2 + c^2} \right)^2 \right] dS \]  

(5)

We see \( \tau(f) \geq \chi(S) \). As S has genus 0 and \( \tau(f) = 2 \), it is an invariant curvatures of curve–surface pair. If \( \tau(f) = 2 \), from (6) \( \sqrt{b^2 + c^2} = \left( a + \frac{bc - b'c'}{b^2 + c^2} \right) \) at each point \( P \in f(S) \). Thus, every point is an umbilic; thus, \( f(S) \) is an Euclidean sphere using curvatures of the invariant curve–surface pair. This completes the proof. \( \square \)

Some information about an upper bound for \( \tau(f) \) may be obtained from the results of Weyl [25].
Theorem 2. The square of the mean curvature $H$ of a convex surface satisfies the inequality

$$
\frac{(b^2 + c^2) + bc - b^2c + c^2}{\sqrt{b^2 + c^2}} + \frac{1}{4} \left( \frac{\sqrt{b^2 + c^2}}{a + \frac{bc - b^2c + c^2}{b^2 + c^2}} \right)^2
\leq \sup_{p \in \mathcal{S}} \left\{ \frac{(a(b^2 + c^2) + bc - b^2c + c^2)}{\sqrt{b^2 + c^2}} - \frac{\Delta (a(b^2 + c^2) + bc - b^2c + c^2)}{\sqrt{b^2 + c^2}} \right\}.
$$

Proof. Let $f(S)$ be a convex surface with surface area $V$ using curvatures of the curve-surface pair. Then, we have

$$
2 \leq \tau(f) \leq \frac{V}{2\pi} \sup_{p \in \mathcal{S}} \left\{ \frac{(a(b^2 + c^2) + bc - b^2c + c^2)}{\sqrt{b^2 + c^2}} - \frac{\Delta (a(b^2 + c^2) + bc - b^2c + c^2)}{\sqrt{b^2 + c^2}} \right\}.
$$

Let us consider the anchor ring $f(T)$ provided by

$$
x = (t + z \cos u) \cos v,
\quad y = (t + z \cos u) \sin v,
\quad z = z \sin u.
$$

The first fundamental coefficients are provided by [1].

$$
K^2 = z^2,
\quad L = 0,
\quad M = (t + z \cos u).
$$

The second fundamental coefficients are provided by

$$
N = z,
\quad O = 0,
\quad P = (t + z \cos u) \cos u.
$$

So, we obtain the mean curvature for the different curve-surface pairs

$$
\frac{\left[ \left( \frac{\sqrt{b^2 + c^2}}{2} \right) + \left( a + \frac{bc - b^2c + c^2}{b^2 + c^2} \right) \right]}{2} = \frac{t + 2z \cos u}{2z(t + z \cos u)},
\quad \frac{\left[ \left( \frac{\sqrt{b^2 + c^2}}{2} \right) + \left( a + \frac{bc - b^2c + c^2}{b^2 + c^2} \right) \right]}{2} = \frac{t + 2z \cos u}{z(t + z \cos u)}.
$$

Thus, we write

$$
\tau(f) = \frac{1}{8\pi} \int_0^{2\pi} \int_0^{2\pi} \left( \sqrt{b^2 + c^2} + a + \frac{bc - b^2c + c^2}{b^2 + c^2} \right)^2 z(t + z \cos u) dudv.
$$

So, we find $\tau(f)$ in the same way as in [1], and that it is invariant, using curvatures of the curve-surface pair. This completes the proof.

4. The Developable Curve-Surface Pairs with an Osculating Darboux Frame

Now, we can give the following definitions, propositions and their proofs using the references [2–23].
Definition 8. Let \((a, S)\) be an orientable curve–surface pair and \(a : I \to S\) be a unit speed curve with a normal curvature \(\kappa_n(s)\), geodesic curvature \(\kappa_g(s)\), and geodesic torsion \(\tau_g(s)\). If \(\varphi(s)\) denotes the angle between the \(\vec{b}\) and \(\vec{c}\). We obtain the following equations,

\[
\begin{align*}
\kappa^2 &= b^2 + c^2 \\
\kappa_{g}(s) &= c = \kappa \sin \varphi \\
\kappa_{n}(s) &= -b = \kappa \cos \varphi \\
\tau_{g}(s) &= a + \frac{b c - b' c}{b^2 + c^2} + \frac{d \varphi}{d s} \\
\vec{\eta}(s) &= \sin \varphi e_2(s) - \cos \varphi e_3(s) \\
\vec{\zeta}(s) &= \cos \varphi e_2(s) + \sin \varphi e_3(s)
\end{align*}
\]

(6)

Definition 9. These equations are part a special vector field on a tangent plane of an orientable curve–surface \((a, S)\):

\[
D_{o(a,S)} = a + \frac{b c - b' c}{b^2 + c^2} \vec{c} + \frac{d \varphi}{d s} \vec{c} + b \vec{c}
\]

called an Osculating Darboux vector of a curve–surface pair, and the normalized osculating Darboux vector field is

\[
\tilde{D}_{o(a,S)} = a + \frac{b c - b' c}{b^2 + c^2} \vec{c} + \frac{d \varphi}{d s} \vec{c} + b \vec{c}
\]

(9)

We obtain,

\[
\delta_{o(a,S)} = c - \frac{b \left(a + \frac{b c - b' c}{b^2 + c^2} + \frac{d \varphi}{d s}\right) + b' \left(a + \frac{b c - b' c}{b^2 + c^2} + \frac{d \varphi}{d s}\right)}{b^2 + \left(a + \frac{b c - b' c}{b^2 + c^2} + \frac{d \varphi}{d s}\right)^2},
\]

(10)

\[
\sigma_{o(a,S)} = \frac{\left(a + \frac{b c - b' c}{b^2 + c^2} + \frac{d \varphi}{d s}\right)}{b^2 + \left(a + \frac{b c - b' c}{b^2 + c^2} + \frac{d \varphi}{d s}\right)^2} \left(\frac{b}{\delta_{o(a,S)} \left(b^2 + \left(a + \frac{b c - b' c}{b^2 + c^2} + \frac{d \varphi}{d s}\right)^2\right)^{\frac{1}{2}}}ight)
\]

(11)

The special case: If \(\varphi = \) constant, then \(\varphi' = 0\). So, the equation is \(a = \tau\). That is, if the angle is constant, then the torsion of the curve–surface pair is equal to the torsion of the curve.

In the same way as reference [16], we obtained the following propositions:

Proposition 1. Let \((a, S)\) be an orientable curve–surface on a closed orientable surface \(S\). Then, \((a, S)\) is congruent to an osculating Darboux curve–surface pair only in the following two cases.

(i) \(b = 0\), \((a, S)\) is a plane curve–surface pair.

(ii) \(b \neq 0\), \((a, S)\) is a curve–surface pair with \(\delta_{o(a,S)} \neq 0\) and \(\sigma_{o(a,S)} = 0\).

Proof. We demonstrate \(i \rightarrow ii\). If \((a, S)\) as a plane curve–surface pair and by (7) and (8), \(\cos \varphi = 0\). So, \((a, S)\) lies in planes \(\{e_1(s), \vec{\eta}(s)\}\) and \(\{e_1(s), e_2(s)\}\). Then, \((a, S)\) is congruent to an osculating Darboux curve–surface pair. Therefore, \((a, S)\) is a curve–surface pair with \(\delta_{o(a,S)} \neq 0\) and \(\sigma_{o(a,S)} = 0\). In a similar way, we demonstrate \(ii \rightarrow i\). Thus, this completes the proof of the proposition. \(\square\)
Proposition 2. Let \((a, S)\) be an orientable curve–surface pair on a closed orientable surface \(S\) with \(b \neq 0\). If \((a, S)\) satisfies two of following conditions, the remaining condition holds up:

(i) \((a, S)\) is an asymptotic curve–surface pair on \(S\).
(ii) \(a(s)\) is a congruent to a rectifying Darboux curve–surface pair on \(S\).
(iii) \((a, S)\) is a curve–surface pair on a planar curve \(a(s)\).

Proof. We demonstrate that if \(i\) holds up, \(ii\) and \(iii\) are equivalent. As \((a, S)\) is an asymptotic curve–surface pair, using (6) and (7), cos \(\varphi = 0\), we obtain \(\vec{\eta}(s) = \pm e_2(s)\). So, this means that \((a, S)\) lies in planes \(\{e_1(s), \vec{\eta}(s)\}\) and \(\{e_1(s), e_2(s)\}\). Thus, \(ii\) and \(iii\) are equivalent. After this, we demonstrate \(ii, iii \Rightarrow i\). As \((a, S)\) lies in planes \(\{e_1(s), e_2(s)\}\) and \(\{e_1(s), \vec{\eta}(s)\}\), this means that \(e_2(s) = \pm \vec{\eta}(s)\). By (6) and (7), cos \(\varphi = 0\), and \(b = 0\). So, \((a, S)\) is an asymptotic curve–surface pair on \(S\). This completes the proof of the proposition.

Proposition 3. Let \((a, S)\) be an orientable curve–surface pair on a closed orientable surface \(S\) with \(c \neq 0\). If \((a, S)\) satisfies two of following conditions, the remaining condition holds up,

(i) \(a(s)\) is a line of curvature curve–surface pair on \(S\).
(ii) \((a, S)\) is a spherical curve–surface pair on \(S\).

Proof. We demonstrate \(i \Rightarrow ii\). If \(a(s)\) is a line of curvature curve–surface pair on \(S\), then, using (10) and (11), we obtain \(c = \text{nonzero const}\). Using 10, by calculations, we obtain \(\frac{\tau}{} + \left[\left(\frac{c}{2}\right)\left(\frac{1}{c}\right)\right] = 0\). Therefore, \((a, S)\) is a spherical curve–surface pair. We demonstrate \(ii \Rightarrow i\). As \((a, S)\) is a spherical curve–surface pair, we obtain \((a, S)\) which lies in planes \(\{e_1(s), \vec{\eta}(s)\}\) and \(\{e_2(s), e_3(s)\}\). Thus, \(a(s) = \gamma(s) \vec{\eta}\). Differentiating \(a(s)\) with respect to \(s\), we use the following equations,

\[
\begin{align*}
\gamma(s)\kappa(s) &= -1 \\
\gamma'(s) &= 0 \\
\gamma(s)\tau(s) &= 0 \\
\end{align*}
\]

(12)

By using these equations, we obtain \(\gamma(s) \neq 0\), so we obtain \(\tau(s) = 0\). Therefore, \(a(s)\) is a line of curvature curve–surface pair on \(S\). This completes the proof of the proposition.

Proposition 4. Let \((a, S)\) be an orientable curve–surface pair on a closed orientable surface \(S\) with \(a = 0\), \(b = 1\) and \(\varphi = \text{const}\). If \((a, S)\) satisfies two of the following conditions, the remaining condition holds up,

(i) \(a(s)\) is a line of curvature of \((a, S)\).
(ii) \(a(s)\) is a congruent to an osculating Darboux curve–surface pair.
(iii) \((a, S)\) is a spherical curve–surface pair.

Proof. We obtain \(i, ii \Rightarrow iii\). As \(a(s)\) is a line of curvature of \((a, S)\), \(\delta_{\varphi(a(S)}) = c\) and \(\sigma_{\varphi(a(S))} = \pm \frac{\kappa}{c^2}\), also we take \(c \neq 0(\text{const})\), \(\kappa = \frac{c}{\sin \varphi}\) and \(a + \frac{b c - b c}{c^2 + c^2} = -\frac{d \varphi}{d s}\). So, we get \(\frac{\tau}{\kappa} + \left[\left(\frac{1}{c}\right)\left(\frac{1}{c}\right)\right] = 0\). Thus, \((a, S)\) is a spherical curve–surface pair. We obtain \(ii, iii \Rightarrow i\). So \((a, S)\) is a spherical curve and congruent to an osculating Darboux curve–surface pair. We show \(iii, i \Rightarrow ii\). Since \((a, S)\) is a spherical curve–surface pair, \(\frac{\tau}{\kappa} + \left[\left(\frac{1}{c}\right)\left(\frac{1}{c}\right)\right] = 0\). Since \(a(s)\) is a line of curvature of \((a, S)\), we get,
Thus, we can write the last equation in the same way as the strip
Theorem 4.

Let \( (\alpha, M) \) be the Frenet–Serret apparatus of the strip \((\alpha, M)\). If the strip \((\beta, M)\), which lies on the tores, intersect the tangent lines orthogonally, it is called an involute of \((\alpha, M)\). If \((\beta, M)\) is an involute of \((\alpha, M)\), then by definition \((\alpha, M)\) is an evolute of \((\beta, M)\).

\[ \psi(s) = \int \left( a(s) + \frac{b(s)c(s) - b(s)c(s)}{b(s)^2 + c(s)^2} \right) ds \]
\[ = \int \frac{c}{1 + c^2} ds \]
\[ = \arctan c(s) \]
\[ = \arctan \kappa_s(s). \]

So we obtain,
\[ \tan \psi(s) = \kappa_s(s) \]

Thus, we get \( \sin \psi(s) = \frac{c}{\sqrt{1 + c^2}}, a_{(a,S)} = c - \frac{c^2}{\sqrt{1 + c^2}} \neq 0 \) and \( \sigma_{(a,S)} = 0 \). Therefore, \((a, S)\) is a congruent to an osculating Darboux curve-surface pair. This completes the proof of the proposition. \( \square \)

5. The Involute Curve–Surface Pair

Now we study the involute of a strip in \( E^3 \).

**Definition 10.** Let \((\alpha, M)\) and \((\beta, M)\) be the strips in \( E^3 \). The tangent lines of a strip generate a surface called the tores of the strip. If the strip \((\beta, M)\), which lies on the tores, intersect the tangent lines orthogonally, it is called an involute of \((\alpha, M)\). If \((\beta, M)\) is an involute of \((\alpha, M)\), then by definition \((\alpha, M)\) is an evolute of \((\beta, M)\).

**Theorem 3.** Let \((\beta, M)\) be the involute of the strip \((\alpha, M)\). The quantities \( \{V_1, V_2, V_3, \kappa, \tau\} \) and \( \{V'_1, V'_2, V'_3, \kappa^*, \tau^*\} \) are collectively the Frenet–Serret apparatus of the curve \( \alpha \) and the involute \( \beta \), respectively. Also, the quantities \( \{\xi, \eta, \zeta, a, b, c\} \) and \( \{\xi^*, \eta^*, \zeta^*, a^*, b^*, c^*\} \) are collectively the Frenet–Serret apparatus of the strip \((\alpha, M)\) and the involute \((\beta, M)\), respectively. The Frenet vectors of involute \( \beta \), based on its evolute curve \( \alpha \), are given in [21] as follows

\[
\begin{align*}
V'_1 &= V_2, \\
V'_2 &= \frac{-\kappa V_1 + \tau V_3}{(\kappa^2 + \tau^2)^{1/2}}, \\
V'_3 &= \frac{\tau V_1 + \kappa V_3}{(\kappa^2 + \tau^2)^{1/2}}.
\end{align*}
\]

Thus, we can write the last equation in the same way as the strip

\[
\begin{align*}
V'_1 &= \cos \varphi \eta^* + \sin \varphi \zeta^* \\
V'_2 &= -(\sqrt{b^2 + c^2} \frac{a}{b^2 + c^2}) \zeta^* - \sin \varphi \left(a + \frac{b^2 - b^2 c^2 + b^2 c^2}{b^2 + c^2}\right) \eta^* + \cos \varphi \left(\frac{b^2 - b^2 c^2}{b^2 + c^2}\right) \zeta^* \\
V'_3 &= \left(a^2 + b^2 + c^2 + \left(\frac{b^2 - b^2 c^2}{b^2 + c^2}\right)^2\right)^{1/2}.
\end{align*}
\]

**Proof.** It is obviously seen from (6) and (14). \( \square \)

**Theorem 4.** Let \( \beta \) be the involute of curve \( \alpha \). The first curvature and the second curvature of involute \((\beta, M)\) are

\[ \kappa^* = \frac{\sqrt{\kappa^2 + \tau^2}}{(c-s)\kappa^*}, (c-s)\kappa > 0, \kappa \neq 0. \]
and

\[ \tau^* = \frac{\kappa \tau' - \kappa' \tau}{(c-s)\kappa(\kappa^2 + \tau^2)} \]

\[ = \frac{-\tau^2 (\frac{\tau}{\kappa})'}{(c-s)\kappa(\kappa^2 + \tau^2)}, \text{c is constant.} \]

So, we can write this in the same way as the curvatures of the strip

\[ \kappa^* = \frac{\sqrt{a^2 + b^2 + c^2 + (\frac{bc-bc_c}{b^2+c^2})^2}}{(c-s)\sqrt{b^2+c^2}}, (c-s)\sqrt{b^2+c^2} > 0, (b^2 + c^2) \neq 0. \]

and

\[ \tau^* = \frac{\kappa \tau' - \kappa' \tau}{(c-s)\kappa(\kappa^2 + \tau^2)} \]

\[ = \frac{-\tau^2 (\frac{\tau}{\kappa})'}{(c-s)\kappa(\kappa^2 + \tau^2)}, \text{c is constant.} \]

**Proof.** It is obviously seen. □

**Theorem 5.** Let \( \beta \) be the involute of the curve \( \alpha \). The modified Darboux vector field of the involute \( \beta \) in type of the strip is

\[ \mathcal{D}^* = \frac{-a + \frac{bc-bc}{b^2+c^2}}{\sqrt{a^2 + b^2 + c^2 + (\frac{bc-bc_c}{b^2+c^2})^2}} V_1 - \frac{(-a + \frac{bc-bc}{b^2+c^2})^2 \left( \frac{\sqrt{b^2+c^2}}{-a + \frac{bc-bc_c}{b^2+c^2}} \right)'}{\left( a^2 + b^2 + c^2 + (\frac{bc-bc_c}{b^2+c^2})^2 \right)^{\frac{3}{2}}} V_2 \]

\[ + \frac{\sqrt{b^2+c^2}}{\sqrt{a^2 + b^2 + c^2 + (\frac{bc-bc_c}{b^2+c^2})^2}} V_3. \]

Also, we find

\[ \mathcal{D}^*_{(\beta,M)} = \frac{-a + \frac{bc-bc}{b^2+c^2}}{\sqrt{a^2 + b^2 + c^2 + (\frac{bc-bc_c}{b^2+c^2})^2}} \xi - \frac{(-a + \frac{bc-bc}{b^2+c^2})^2 \left( \frac{\sqrt{b^2+c^2}}{-a + \frac{bc-bc_c}{b^2+c^2}} \right)'}{\left( a^2 + b^2 + c^2 + (\frac{bc-bc_c}{b^2+c^2})^2 \right)^{\frac{3}{2}}} \left( \cos \phi \ \eta' + \sin \phi \ \zeta' \right) \]

\[ + \frac{\sqrt{b^2+c^2}}{\sqrt{a^2 + b^2 + c^2 + (\frac{bc-bc_c}{b^2+c^2})^2}} \left( -\sin \phi \ \eta' + \cos \phi \ \zeta' \right) \]

\[ \mathcal{D}^*_{(\beta,M)} = \frac{-a + \frac{bc-bc}{b^2+c^2}}{\sqrt{a^2 + b^2 + c^2 + (\frac{bc-bc_c}{b^2+c^2})^2}} \overline{\xi} - \frac{(-a + \frac{bc-bc}{b^2+c^2})^2 \left( \frac{\sqrt{b^2+c^2}}{-a + \frac{bc-bc_c}{b^2+c^2}} \right)'}{\left( a^2 + b^2 + c^2 + (\frac{bc-bc_c}{b^2+c^2})^2 \right)^{\frac{3}{2}}} \left( \cos \phi - \sin \phi \right) \eta' \]

\[ + \frac{\sqrt{b^2+c^2}}{\sqrt{a^2 + b^2 + c^2 + (\frac{bc-bc_c}{b^2+c^2})^2}} \left( \sin \phi + \cos \phi \right) \zeta'. \]

This is the modified Darboux vector field of the involute \((\beta,M)\).
Corollary 1. If the second curvature $\tau$ of curve $\alpha$ is a non-zero constant, then $\tau' = 0$. Hence, we have that the modified Darboux vector field of the involute $\beta$ in type of the strip is

$$D^* = \frac{k_2}{\sqrt{k_1^2 + k_2^2}} V_1 - \frac{k_1 k_2}{(k_1^2 + k_2^2)^{3/2}} V_2 + \frac{k_1 V_3}{\sqrt{k_1^2 + k_2^2}}.$$

Also, we find $\tilde{D}^*$ in type of curve–surface pair:

$$\tilde{D}^*_{(s,M)} = \frac{-a + \frac{bc - bc'}{b^2 + c^2}}{\sqrt{a^2 + b^2 + c^2 + \left(\frac{bc - bc'}{b^2 + c^2}\right)^2}} \xi - \frac{(b^2 + c^2) \left(-a + \frac{bc - bc'}{b^2 + c^2}\right)}{\left(a^2 + b^2 + c^2 + \left(\frac{bc - bc'}{b^2 + c^2}\right)^2\right)^2} \left(\cos \varphi \eta + \sin \varphi \zeta'\right)$$

$$+ \frac{(b^2 + c^2)}{\sqrt{a^2 + b^2 + c^2 + \left(\frac{bc - bc'}{b^2 + c^2}\right)^2}} \left(-\sin \varphi \eta' + \cos \varphi \zeta\right).$$

$$\tilde{D}^*_{(s,M)} = -\frac{a(b^2 + c^2) + bc - bc'}{\sqrt{(a^2 + b^2 + c^2)(b^2 + c^2)^2 + (bc - bc)^2}} \xi$$

$$- \frac{(b^2 + c^2)(b^2 + c^2)^3(-a(b^2 + c^2) + bc - bc')}{(a^2 + b^2 + c^2)(b^2 + c^2)^2 + (bc - bc)^2} \left(\cos \varphi \eta' + \sin \varphi \zeta\right)$$

$$+ \frac{(b^2 + c^2)^2}{\sqrt{(a^2 + b^2 + c^2)(b^2 + c^2)^2 + (bc - bc)^2}} \left(-\sin \varphi \eta' + \cos \varphi \zeta\right).$$

Proof. This is proven by the last two theorems. □

Theorem 6. In $\mathbb{E}^3$, the modified Darboux vector fields of a curve–surface pair $(\alpha, M)$ and its involute $\beta$ can not be perpendicular to each other. Proof. The inner product of the curve–surface pair $(\alpha, M)$ and its involute $\beta$ is obviously proven. Their inner product is not equal to zero. So, the modified Darboux vector fields of a curve–surface pair $(\alpha, M)$ and its involute $\beta$ can not be perpendicular to each other. This completes the proof. □

6. The $\tilde{D}$-Scroll and Involute $\tilde{D}^*$-Scroll of the Curve-Surface Pair in the $\mathbb{E}^3$

In this section, we consider the differential geometric and fundamental elements of the special ruled surface $\tilde{D}$-scroll of the curve–surface pair evolute $(\alpha, M)$ and involute $\beta$.

A ruled surface is shown as a set of points whisked by a moving straight line. A ruled surface is one generated by the motion of a straight line in $\mathbb{E}^3$ [21]. Choosing a directrix on the surface, i.e., a smooth unit speed curve–surface pair $(\alpha, M)(s)$ orthogonal to the straight lines, and then choosing $\omega(s)$ to be unit vectors along the curve in the direction of the lines, velocity vectors $(\alpha, M)_s$ and $\omega$ satisfy $\langle (\alpha, M)'(s), \omega \rangle = 0$. So, it is called the $B$-scroll of the curve-surface. The special ruled surfaces $B$-scroll of the curve-surface over null curves with null rulings in 3-dimensional Lorentzian space form were introduced by L. K. Graves. The first, second, and third fundamental forms of B-scrolls have been examined in [14].

Definition 11. Let $(\alpha(s), M(s))$ be the arclengthed curve–surface pair. Equation

$$\psi^*(s, u) = (\alpha(s), M(s)) + u\zeta(s)$$

is the parametrization of the ruled curve–surface, which is called B-scroll (binormal scroll).
Definition 12. Let curve $\beta$ be the involute of $\alpha$, hence 
\[
\psi^\ast M(s, \nu) = (\beta, M)(s) + \nu D^\ast M(s) \\
= (\beta, M)(s) + \nu \left( \frac{a^\ast}{b^\ast}(s) \xi^\ast(s) + \zeta^\ast(s) \right)
\]
is the parametrization of the $D$-scroll of involute $\beta$ of the curve–surface pair. This rectifying developable surface is called Involute $D$-scroll of $(\alpha, M)$.

Theorem 7. If $\beta$ is the involute curve of curve $\alpha$, then the parametrization of the involute $D$-scroll in terms of the Frenet–Serret apparatus of the curve $\alpha$ is
\[
\psi^\ast M(s, \nu) = \alpha + \left( \lambda + \frac{\nu k_2}{\sqrt{a^2 + b^2 + c^2}} \right) \xi - \frac{k_2^2 \left( \frac{b_1}{k_2} \right)^{\prime}}{(a^2 + b^2 + c^2)^{\frac{3}{2}}} \eta + \frac{\nu k_1}{\sqrt{a^2 + b^2 + c^2}} \zeta.
\]

Proof. The Definition 11 and the formulae of the curvatures of curve–surface pair can clearly be seen. \[\square\]

Corollary 2. If the second curvature $\tau$ of the curve $\alpha(s)$ is constant but not equal to zero, then $\tau’ = 0$. Hence, the parametrization of involute $D$-scroll is
\[
\psi^\ast(s, \nu) = \alpha + \left( c - s + \frac{\nu(-a + \frac{bc-bc}{a^2+b^2+c^2})}{\sqrt{a^2 + b^2 + c^2}} \right) \xi - \nu \left( \sqrt{b^2 + c^2} \right)^{\prime} \left( -a + \frac{bc-bc}{a^2+b^2+c^2} \right) \eta + \\
\frac{\nu \left( \sqrt{b^2 + c^2} \right)}{\sqrt{a^2 + b^2 + c^2} + \left( \frac{bc-bc}{a^2+b^2+c^2} \right)^2} \zeta.
\]

Proof. The formulae of curvatures for the curve–surface pair and formulae of $D$-scroll and involute $D$-scroll can clearly be seen. \[\square\]

Theorem 8. The $D$-scroll and the involute $D$-scroll of a non-planar curve–surface pair $\alpha$ and $(\alpha, M)$ do not intersect each other, where $c \neq s$.

Proof. Further, we know that $|c-s|, \forall s \in I, c = constant$, is the distance between the arclengthed curves $(\alpha, M)$ and $(\beta, M)$. So, the $D$-scroll and the involute $D$-scroll of a non-planar curve–surface pair $\alpha$ and $(\alpha, M)$ do not intersect each other, where $c \neq s$. This proves the theorem. \[\square\]

7. Conclusions
In this work, we investigated the Gaussian and mean curvatures of curve–surface pairs using embedded surfaces. Next, we provided some extensible operations of the curve–surface pairs using the Gauss–Bonnet theorem for embedded surfaces. Moreover, we studied developable curve–surface pairs with position vectors lie in planes spanned by an osculating Darboux frame, and characterized these surfaces using similar procedures as those in the papers of [1,12]. Finally, by referring [21], we examined the $D$-scroll and the involute $D$-scroll of the curve–surface pairs.
